The performance of Stearns brakes, clutches, clutch-brake combinations, solenoids, and controls depends upon the proper application of the product, adequate run in, installation and maintenance procedures, and reasonable care in operation.

All torque values listed in our bulletins are nominal and are subject to the variations normally associated with friction devices. The purchaser should take into consideration all variables shown in the applicable specification sheets. Although our application engineers are available for consultation, final selection and performance assurance on the purchaser's machine is the responsibility of the purchaser. Careful purchaser selection, adequate testing at time of installation, operation and maintenance of all products of Rexnord Industries, LLC, Stearns Division are required to obtain effective performance.
Stearns warrants to its purchasers that all its products will be free from defects in material and workmanship at the time of shipment to the purchaser for a period of one (1) year from the date of shipment. All warranty claims must be submitted in writing to Stearns within the warranty period, or shall be deemed waived. As to products or parts thereof which Stearns finds to have been defective at the time of shipment, its sole responsibility hereunder shall be to repair, correct or replace (whichever Stearns deems advisable) such defective products or parts without charge, FOB Stearns factory. In the alternative, Stearns may, at its option, either before or after attempting a different remedy, refund the purchase price upon return of the product or parts.

This warranty shall not apply to any product which has been subjected to misuse: misapplication: neglect (including but not limited to improper maintenance and storage); accident: improper installation; modification (including but not limited to use of other than genuine Stearns replacement parts or attachments); adjustment; or repair.
THE FOREGOING IS IN LIEU OF ALL OTHER WARRANTIES, WHETHER EXPRESSED, IMPLIED, OR STATUTORY, INCLUDING THAT OF MERCHANTABILITY AND OF FITNESS FOR A PARTICULAR PURPOSE, AND OF ANY OTHER OBLIGATION OR LIABILITY ON OUR PART OF ANY KIND OR NATURE WHATSOEVER.
No Stearns representative has any authority to waive, alter, vary or add to the terms hereof without prior approval in writing, to our purchaser, signed by an officer of Rexnord Industries, LLC.
Stearns liability for its products, whether for breach of contract, negligence, strict liability in tort, or otherwise, shall be limited to the repair, correction, or replacement of the products or parts thereof, or to the refund of the purchase price of such products or parts. Stearns will not be liable for any other injury, loss, damage or expense, whether direct or consequential, including but not limited to loss of use, income, profit or production, or increased cost of operation, or spoilage of or damage to material, arising in connection with the sale, installation, use of, inability to use, or the repair or replacement of, or late delivery of, Stearns products.
Any cause of action for breach of the foregoing warranty must be brought within one (1) year from the date the alleged breach occurs.

Note on Special (Nuclear) Applications:
"Rexnord Industries, LLC, Stearns Division products are designed for standard industrial and commercial applications. Operating requirements, environments and required tolerances in nuclear and aircraft applications may be beyond the commercial standards of the Stearns Divisions products. Rexnord Industries, LLC, Stearns Division will assume absolutely no responsibility for the use of and/or resale of Rexnord Industries, LLC, Stearns Division products for such applications unless approved in writing in advance by Rexnord Industries, LLC, Stearns Division."

## Stearns Brakes Set the Standard for Excellence

Stearns offers the most comprehensive line of solenoid actuated brakes (SAB's) on the market today. We have earned the reputation as the industry's quality leader by working closely with you, our customers, understanding your needs and developing products with design features to handle your most challenging applications. We have installed millions of Stearns brakes worldwide since 1935. Many brakes operating today are 40 years old or more; evidence of our product quality and reliability.

Stearns motor brakes can be mounted directly to an electric motor or foot mounted. The compact design delivers high torque in a small size with fast, positive response and no residual drag when released. Our brakes can be mounted directly onto NEMA C-face motors without special alignment procedures. Many motor manufacturers offer a brake kit which will convert a stock fan-cooled motor into a brakemotor. Stearns Solenoid Actuated Brakes feature unitized construction which makes servicing friction discs easy using only a screwdriver and wrench. The Stearns SAB ensures automatic stopping and holding any time power to the brake is interrupted. And, as with ALL Stearns products, the friction material is nonasbestos.
We can produce a brake which meets your specifications, including metric mounting. Chances are, we've already manufactured similar requirements from a long list of pre-engineered options.

## Enclosure Types

Stearns brakes, when properly installed, are provided in a variety of IP enclosure types.
IP 21 - intended for general purpose, indoor applications, as a ventilated enclosure. Protected against dripping water.

IP 23 - intended for indoor applications, as a non-ventilated enclosure. It provides protection against falling, non-corrosive dirt and liquid. Protected against spraying water.
IP 54 - intended for dust protected indoor and outdoor applications. Protected against splashing water.

IP 55 - intended for dust protected indoor and outdoor applications. Protected against water jets.

IP 56 - intended for dust protected indoor and outdoor applications. Protected against heavy seas or powerful jets.
IP 57 - intended for dust protected indoor and outdoor applications. Protected against the effects of immersion.

NOTE: IP 21, 23 \& 54 - formerly referred to by Stearns as NEMA 1, 2 \& 4 respectively.

IP 55, 56 \& 57 - formerly referred to by Stearns as NEMA Type 4X (BISSC Certified with epoxy coating and stainless steel hardware on exterior, or with a stainless steel enclosure).

## Self-Adjusting Disc Brakes

Remote inaccessible locations or high cycling applications require a specially designed, lowmaintenance brake that will operate at peak efficiency and provide uniform braking for long periods of time. Stearns exclusive self-adjusting feature helps eliminate the
 major cause of brake maintenance friction lining wear. Self-adjusting brakes are also well suited for applications where rapid cycling requires frequent resetting of solenoid air gap. Automatic adjustment also eliminates the errors that can occur with hand adjustment. They can be easily modified to suit your particular application.
Depending upon the series you select, these brakes can be direct mounted on motors ranging in size from NEMA 182TC through NEMA 505C.

## Manually Adjusted Disc Brakes with Automatic Reset

It's an unbeatable combination; the features you want most in spring-set disc brakes. Standard features now include: a unique spring design which allows for universal mounting, an air gap adjustment gauge for visual recognition that the brake needs adjustment, a new patented hub design, and genuine Stearns friction discs which are trademarked and patented. The 56 Series Brakes come in static torque ratings from 1.5 through 25 lb -ft with NEMA C-face mountings 56C, 143TC, 145TC, 182TFC and 184TFC. Ten different housing, endplate, and release configurations, with a wide variety of preengineered modifications, you can select from 120,000 possible combinations! In addition, for holding applications where friction disc wear is not a factor, Stearns 87,000 Series Brakes are available with an optional manual adjust. The 87,000 Series Brakes are available in static torque ratings from $6 \mathrm{lb}-\mathrm{ft}$ through 105 lb -ft, with NEMA C-face moutings, 182TC through 286TC.

## Brakes for Hazardous Locations

Although rugged Stearns Brakes are built to withstand rigorous industrial environments, many applications require additional protection from explosive gases or ignitable dusts. Stearns manufactures a
 complete line of disc brakes designed from the hazardous locations defined in the National Electric Code (NEC). Each brake is labeled to show the Class, Group, and maximum operating temperature of the brake enclosure. We offer both motor-mounted and footmounted designs, and all Stearns Hazardous Location Brakes are UL Listed and CUL or CSA certified.
Double C-Face Disc Brake Couplers
Stearns Disc Brake Couplers provide maximum versatility, allowing you to add a brake to a C-face motor with a single shaft extension. Using these reliable products, you can
 couple a C-face motor to a C -face gear reducer.

## Washdown Brakes

Stearns Washdown Brakes include the 56,000 and 87,000 Series brake models. These brakes meet BISSC Standards, AAA Dairy Standards, and other food industry washdown requirements. They feature stainless steel hardware, neoprene gasketing, and FDAapproved white epoxy paint or stainless steel enclosure.

Solenoid Actuated Brakes versus Armature Actuated Brakes

| Solenoid Actuated Brakes | Armature Actuated Brakes |
| :--- | :--- |
| Simple wear adjustment | Complex wear adjustment |
| Easy coil exchange for different <br> voltages | Difficult to change out complete <br> magnet assembly |
| Maintained manual release with <br> automatic reset for brake release <br> during set-up | Non-maintained release (deadman) <br> requires constant external force <br> to operate |
| Add on options easily assembled <br> to standard unit | Options require complete brake <br> in most units |
| Rapid set and release times. | Response time is slower due to <br> required magnetic field build-up <br> in magnet-style coil |
| Connection can be made directly to <br> AC power source | Direct connection to AC power source <br> requires an optional electric control |

## Marine Applications

Brakes used in marine applications are customized to meet specific standards. These standards are established to provide various levels of corrosion resistance and performance standards under specific conditions.

## Maritime and

 Naval Brakes are designed for U.S. Navy and Coast Guard military specifications. These units conform to MIL-B-16392C or 46CFR 110.10-1 and IEEE Standard 45 . Special material components help prevent corrosion due to shipboard environments. SAB's used in marine environments can be custom built to meet the specifications. In addition, all Stearns SAB's are "Type Approval Certified" by the American Bureau of Shipping.
Today, Stearns is focused on being your worldwide, value-added supplier. Our factory-trained field sales force is available to work with you in person to determine your application needs, as well as provide training and support to your engineers and maintenance staff. Our extensive network of more than 900 distributor branches is your assurance of quality service after the sale.
Stearns is a division of Rexnord Industries, LLC, a world leader in power transmission products. We have the resources, experience and dedication to meet your industrial brake, clutch and solid-state electronic centrifugal switch needs.

## Trademarked and Patented Friction Discs

Now you can rely on identifying genuine Stearns Friction Discs which assure continuous, reliable performance backed by the Stearns name.
A molded ring in the Stearns friction discs makes it easy to visually identify a Stearns disc. The new splined discs are trademarked and patented by Stearns Division, Rexnord Industries, LLC.

## Manually Adjusted Solenoid Actuated Brakes

Stearns manually-adjusted disc brakes are available from .5 to $105 \mathrm{lb}-\mathrm{ft}$ static torque. They feature spring-set, electrically released designs having simple adjustments to compensate for friction lining wear. All have simple 2-wire motor connection.

## Series 48,100 Disc Brakes

Mount directly to NEMA 48C motor frames. Static torque ratings are $11 / 2,3$ and $6 \mathrm{lb}-\mathrm{ft}$.

## Quality Design Features:

- Spring-set, electrically released
- Single-disc caliper design
- Simple wear adjustment for easy maintenance
- Knock-out plug on housing for through-shaft applications
- Maintained manual release with automatic reset
- Mount in any position without modification

## All Series 56,X00 Disc Brakes

Mount directly to NEMA 56C, 143TC, 145TC, 182TC and 184TC motor frames. Static torque ratings from $11 / 2$ to $25 \mathrm{lb}-\mathrm{ft}$.
The 56 Series family is an unbeatable combination: the features you want most in spring-set disc brakes, at a low price. We took a fresh look at the brake itself as well as your needs and designed a comprehensive line of spring-set brakes that set new standards for quality,
reliability and customer convenience. Here's a sampling of the features we've built into the Stearns 56 Series brakes:

- A Stearns-exclusive spring design permits all-position mount for unlimited mounting possibilities.
- Trademarked and patented friction discs
- Patented splined hub that increases friction disc working area, runs quieter, and offers enhanced heat dissipating capability
- ABS Type Approval Certified

The 56 Series come in static torque ratings from 1.5 through 25 lb -ft with NEMA C-face mountings 56C, 143TC, 145TC, 182TFC, and 184TFC. Ten different housing, endplate, and release configurations accommodate IP 23, IP 54, IP 55, IP 56 and IP 57 enclosures. With a wide variety of pre-engineered modifications, you can select from 120,000 possible combinations!

## 87,000 Series Disc Brakes

An optional manual adjust mechanism can be provided on 87,000 Series Brakes (does not include 87,300 and 87,800 Series Brakes). Mounted directly to NEMA 182TC through 256TC frames. Includes all the other features of the Series 87,000 .

## Series 56,000 Design Features

Stearns self-adjusting disc brakes feature an exclusive, automatic adjusting device that eliminates the major cause of brake maintenance adjustment to compensate for friction lining wear. This feature makes Stearns self-adjusting brakes ideal for remote or inaccessible locations, and for applications where rapid cycling requires frequent wear adjustment of manual adjustable brakes.
The self-adjust mechanism is a simple wrap-spring clutch that automatically adjusts the brake's solenoid air gap to compensate for wear of the friction discs. Automatic adjustment occurs every time the brake is operated, eliminating the errors that can occur with hand adjustment. The self-adjust feature means Stearns motor brakes always operate at peak efficiency, providing more uniform braking, longer disc life, less maintenance time and smooth, quiet operation.

There are nine series of Stearns self-adjusting brakes to select from:

- Series 81,000 brakes for direct mounting to NEMA 324TC through 365TC motor frames. Static torque ratings from 125 to $230 \mathrm{lb}-\mathrm{ft}$.
- Series 82,000 brakes for direct mounting to NEMA 324TC through 405TSC motor frames. Static torque ratings from 125 to $440 \mathrm{lb}-\mathrm{ft}$.
- Series 86,X00 brakes for direct mounting to NEMA 444TSC through 505TSC motor frames. Static torque ratings from 500 to $1,000 \mathrm{lb}-\mathrm{ft}$.
- Series 87,X00 brakes for direct
mounting to NEMA 182TC through 286TC motor frames. Static torque ratings from 6 to $105 \mathrm{lb}-\mathrm{ft}$.
- Series 87,200 for floor mounted, double shaft output with bearing support. Static torque ratings from 10 to $105 \mathrm{lb}-\mathrm{ft}$.
- Series 87,300 hazardous location brakes for UL Listed Division I applications, which mount directly to NEMA 182TC through 256TC motor frames. Static torque ratings from 10 to $105 \mathrm{lb}-\mathrm{ft}$.
- Series 82,300 hazardous location brakes for UL listed Division I
applications, for mounting directly to NEMA 324TC through 405TSC.
Static torque ratings 125 to $330 \mathrm{lb}-\mathrm{ft}$.
- Series 87,700 brakes for in-line applications, to couple the motor and gear box. For direct mounting to NEMA 182TC through 256TC motor frames. Torque Rating of 10 to $105 \mathrm{lb}-\mathrm{ft}$.
- Series 87,800 brakes hazardous location brake for UL Listed Division 2 applications, which mount directly to NEMA 182TC through 256TC motor frames. Static torque ratings of 10 to $105 \mathrm{lb}-\mathrm{ft}$.

## Lever Arm and Self-Adjusting Mechanism

## Quality Design Features

- Spring-set, electrically released.
- Self-adjusting mechanism minimizes maintenance by automatically compensating for lining wear.
- Unitized construction for easy friction disc replacement.
- Maintained manual release with automatic reset.
- Simple 2-wire motor connection.
- Standard or dust-tight, waterproof enclosures available.
- Many modifications for special application requirements.
- Models for marine and maritime applications.
- Models in accordance with Military Specification B16392-C for Navy applications.
- ABS Type Approval Certified.

NOTE: For overhauling/high inertia loads, to stop in a specified time/distance, or for brakes combined with variable frequency drives, please refer to Application Engineering Section.

Stearns Solenoid Actuated Brakes can be easily selected from Table 1 and 2.
Given motor data:

1. Horsepower (hp)
2. Speed (RPM)
3. NEMA C-face frame size

## Determine:

1. Static torque rating of the brake (lb-ft)
2. Brake series

Step 1 - Given the motor horsepower and speed, select the brake torque from Table 1. Torque in table 1 is calculated using formula:

$$
\mathrm{T}_{\mathrm{S}}=\frac{5,252 \times \mathrm{P}}{\mathrm{~N}} \times \mathrm{SF}
$$

Where, $\mathrm{T}_{\mathrm{S}}=$ Static torque, $\mathrm{lb}-\mathrm{ft}$

$$
\mathrm{P}=\text { Motor horsepower, hp }
$$

$N=$ Motor full load speed, rpm
SF = Service Factor
5,252 = constant
Example: Given a $5 \mathrm{hp}, 1800$ RPM motor, the selected brake is 20 or $25 \mathrm{lb}-\mathrm{ft}$.

Step 2 - Given the NEMA C-face motor frame size, select the brake series from Table 2.
Example: Given the $5 \mathrm{hp}, 1800$ RPM motor in Step 1 with a NEMA 184TC frame, Series 87,000 ; 87,300 or 87,700 Brakes can be selected to mount directly to the motor.

Table 1 - Torque Selection
In this table, brake torque ratings are no less than 140\% of the motor full load torque.

| Motor hp | Brakemotor Shaft Speed (RPM) |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 700 | 900 | 1200 | 1500 | 1800 | 3000 | 3600 |
|  | Static Torque Rating of Brake (lb-ft) |  |  |  |  |  |  |
| 1/6 | 3 | 1.5 | 1.5 | 1.5 | 0.75 | 0.5 | 0.5 |
| 1/4 | 3 | 3 |  | 1.5 | 1.5 | 0.75 | 0.5 |
| 1/3 | 6 | 3 | 3 | 3 | 1.5 | 1.5 | 0.75 |
| 1/2 | 6 | 6 | 3 | 3 | 3 | 1.5 | 1.5 |
| $3 / 4$ | 10 | 6 | 6 | 6 | 6 | 3 | 3 |
| 1 | 15 | 10 | 6 | 6 | 6 | 3 | 3 |

(1) Brake mounts directly to motor C-face.
(2) Adapter required to mount brake to motor C-face. Refer to brake specifications for adapter information.
(3) Brake endplate modified for direct mounting to motor C-face without an adapter.
(4) Brake is foot mounted for coupling to a hazardous-location motor.

## 3.0" AK, 3.75" AJ

Static Torque: 1.5 through $6 \mathrm{lb}-\mathrm{ft}$
Enclosure: IP23 (formerly referred to by Stearns as NEMA 2), Stamped Steel Housing
Release Type: Side Lever
Installation and Service Instructions: P/N 8-078-924-06

Parts List: P/N 8-078-914-02

## - Adjustable Torque <br> - Manual Wear Adjustment <br> - Side Manual Release Lever with Automatic Reset

- Class B Coil Insulation
- Spring-Set Electrically Released
- Lead Wire Length: 24 inches
- Maximum Speed: Horizontal 5000 rpm
- Certified: CSA File LR-6254.

## Specifications

| Nominal Static Torque | Number of Friction Discs | Coil Size |  | Maximum Solenoid Cycle Rate 1 |  | Thermal Capacity (2) | Inertia (WK ${ }^{\text {2 }}$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| lb-ft <br> (Nm) |  | AC | DC | cyc | min | hp-sec/min | $1 \mathrm{~b}-\mathrm{ft}^{2}$ |
|  |  |  |  | AC | DC | (watts) | $\left(\mathrm{kgm}^{2} \times 10^{-4}\right)$ |
| $\begin{aligned} & 1.5 \\ & \text { (2) } \end{aligned}$ | 1 | 4 | 4 | 40 | 20 | $\begin{gathered} 4 \\ (50) \end{gathered}$ | $\begin{gathered} .003 \\ (1.26) \\ \hline \end{gathered}$ |
| $\begin{gathered} 3 \\ (4) \end{gathered}$ | 1 | K4 | 4 | 36 | 20 | $\begin{gathered} 4 \\ (50) \end{gathered}$ | $\begin{gathered} .003 \\ (1.26) \end{gathered}$ |
| $\begin{gathered} 6 \\ \text { (8) } \\ \hline \end{gathered}$ | 1 | M4 | K4 | 36 | 20 | $\begin{gathered} 4 \\ (50) \\ \hline \end{gathered}$ | $\begin{gathered} .003 \\ (1.26) \\ \hline \end{gathered}$ |

(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with $50 \%$ duty cycle. Does not relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Derate thermal capacity by $25 \%$ for vertical mounting. Refer to Selection Procedure Section.

For DC Voltage add $\$ 300.00$. Includes DC electronic switch (polarized).

## The $56, \mathrm{X} 00$ Series have the following design features:

- Spring-Set Electrically Released
- Static Torque 1.5 through $25 \mathrm{lb}-\mathrm{ft}$
- Adjustable Torque, down to $50 \%$ of rated nameplate torque
- Manual Wear Adjustment
- Airgap Adjust Gage
- Splined Hub

## Product Overview

- IP 21, 23 \& 54 (formerly referred to by Stearns as NEMA type $1,2 \& 4$ respectively) IP 55, 56, \& 57 (formerly referred to by Stearns as NEMA Type 4X (BISSC Certified with epoxy coating and stainless steel hardware on exterior or with a stainless steel enclosure)
- Universal mounting through $15 \mathrm{lb}-\mathrm{ft}$. The 20 and $25 \mathrm{lb}-\mathrm{ft}$ are supplied with springs for vertical modification.

## Specifications:

- Lead Wire Length: 24 inches
- Maximum Speed:

Horizontal 5000 rpm
Vertical 3600 rpm

- Coil Insulation: Standard Class B

Optional Class H
(56,800 Series Class H standard)

- Certified: CSA File LR-6254
- ABS Type Approval Certified

## 56000 Series

Designed for industrial applications requiring high performance in a compact lightweight package.
Construction:
Die cast aluminum endplate with stamped steel housing
Available Enclosures:
IP 23, 54 \& 55
Release Type:
External knob manual release with or without automatic reset
Through Shaft Capability: Yes (IP 23 only)

## 56200 Series

Designed for industrial applications requiring the protection of a heavy duty cast iron enclosure.

Construction:
Cast iron endplate and housing.
Available Enclosures: IP 56 \& 57
Release Type:
External side lever release with automatic reset
Through Shaft Capability: Yes

## 56500 Series

Same as 56000 Series with 182TC / 184TC mounting.
Construction:
Cast iron endplate with stamped steel housing
(Direct mount to 182TC / 184TC)
Available Enclosures:
IP 23, 54 \& 55
Release Type:
External knob manual release with or without automatic reset

Through Shaft Capability: Yes (IP 23 only)

## 56900 Series

For use in severe environments found in process industries such as food, pulp and paper mills and chemical plants.
Construction: Stainless steel
Release Type:
Side lever with automatic reset
Available Enclosures: IP 56 \& IP 57
Through Shaft Capability: with IP43 rating only

## 56700 Series

Units designed for industrial applications that fit between a standard C-Face motor and gear reducer. Can also be used to retrofit installed units without braking capability.
Construction: Die cast aluminum endplate and housing
Available Enclosures:
IP 23, 54, 55 \& 56
Release Type: External knob release with automatic reset
C-face brake has output shaft

## Also Available . . .

## 56100 Series

Full die cast aluminum endplate and housing with internal release lever
Available Enclosures:
IP 23, 56 \& 57

## 56300 Series

Die cast aluminum endplate with stamped steel housing and external maintained release, IP 21

## 56400 Series

Cast iron endplate with stamped steel housing and external knob release Available Enclosures: IP 23 \& 54

## 56600 Series

Cast iron endplate and housing with internal release lever
Available Enclosures: IP 23, 56 \& 57

# Series 56,000; 56,100; 56,200; 56,300; 56,400; 56,500; 56,600; 56,700; and 56,900 Mounting Face: NEMA 56C, 143TC and 145TC 

## Engineering Specifications

Maximum Solenoid Cycle Rate: (1)
AC 36 cycles/min
DC 10 cycles/min

Thermal Capacity: (2)
Horizontal 9 hp-sec/min (112 watts)
Vertical $6.5 \mathrm{hp}-\mathrm{sec} / \mathrm{min}$ (80 watts)
(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with 50\% duty cycle
Does not relate to brake cycle rate (see Thermal Capacity).
2) Thermal capacity rating is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Refer to Selection Procedure Section

Motor Frame Adapters: Series 56,000 through 56,600
WARNING! Before selecting an adapter to mount a brake on a larger motor frame, the torque and thermal capacity required by the application should be determined as shown in the "Selection Procedure" section. A larger motor may indicate a requirement for greater thermal capacity than the brake is designed for. The brake selection must be matched to the motor and application requirements, before use of an adapter is considered.

| To Adapt to NEMA Frame Size | AK Dim. | Reg. No. | Brake Enclosure (1) | Brake Torque | Adapter Stock Number | Additional Shaft Length Required |

| $25(34)$ | 3 | $\mathrm{M} 4+$ | $\mathrm{P} 4+$ | $.020(8.40)$ |

Brake set and release times in milliseconds, when brake and motor are switched separately (for T1/T2 definitions, see page 101):

| Static <br> Torque lb-ft | Coil Size | T1 | T2 |
| :---: | :---: | :---: | :---: |
| $1.5-25$ | $4, \mathrm{~K} 4, \mathrm{~K} 4+, \mathrm{M} 4+$ | 25 | 14 |

## Ordering and Identification Information

The following example and tables provide information for selecting the appropriate three-letter suffix when ordering a Stearns Brake.

Example of a complete part number:

| 1-056-034-00-BFF - Lead wire position |  |
| :---: | :---: |
| Series $ل$ | (internal and external, left and right) standard |
| Torque | - 230 Vac |
| Enclosure | $5 / 8$ bore and |
|  | $3 / 16 \times 3 / 32$ keyway |

Hub Selection

| Character | Bore (in.) | $\begin{aligned} & \text { Keyway** } \\ & \text { (in. x in.) } \end{aligned}$ |
| :---: | :---: | :---: |
| A* | 5/8 | 1/8 $\times 1 / 16$ |
| B | 5/8 | 3/16 x 3/32 |
| C | 3/4 | 3/16 x 3/32 |
| D | 7/8 | 3/16 x 3/32 |
| E | 1-1/8 | $1 / 4 \times 1 / 8$ |
| $\mathrm{F}^{*}$ | 1-1/4 | $1 / 4 \times 1 / 8$ |
| K | 1/2 | $1 / 8 \times 1 / 16$ |
| L* | 1 | $1 / 4 \times 1 / 8$ |
| N* | 9/16 | 1/8 $\times 1 / 16$ |
| O* | 11/16 | 3/16 x 3/32 |
| P* | 1-1/16 | $1 / 4 \times 1 / 8$ |
| R* | 13/16 | 3/16 x 3/32 |
| S* | 15/16 | $1 / 4 \times 1 / 8$ |
| Z | . 460 | pilot bore |

Minimum bore is .500. Maximum allowable bore is 1.25 . (maximum shaft length not to exceed end of hub) For through-shaft applications, .875 is maximum
*These bores are non-standard. Add $\$ 225.00$ to list price
**Keyseats made to ANSI B17.1 Standard.

Standard AC
Voltage Ratings

| Character | Voltage | Hz |
| :---: | :---: | :---: |
| B | 115 | 60 |
| D | 110 | 50 |
| E | 200 | 60 |
| F | 230 | 60 |
|  | 190 | 50 |
| H | 220 | 50 |
| L | 460 | 60 |
|  | 380 | 50 |
| M | 415 | 50 |
| N | 575 | 60 |
| O | $110 / 220$ | 50 |
| P | $115 / 208-230$ | 60 |
| Q | $208-230 / 460$ | 60 |
| R | $190 / 380$ | 50 |
|  | $200 / 400$ | 60 |

Direct Current

| Char- <br> acter | Voltage |
| :---: | :---: |
| T | 12 |
| U | 24 |
| V | 36 |
| W | 48 |
| X | 95 |
| Y | 115 |
| Z | 230 |

Consult factory if other DC voltage is needed.

Voltages below 70VDC are polarity sensitive.

Modifications are availablesee SAB Modification Section

Dimensional Drawings are on the pages following.

*Subtract $\$ 30.00$ for brake ordered less hub.

## Series 56,400 (1-056-4XX)

56,400 Series: Stamped steel housing, cast iron endplate. Enclosure Protection: IP 23 \& 54 (formerly referred to by Stearns as NEMA 2 \& 4 respectively)
Release Type: Knob, maintained Mounting: Fanguard-mounted brakes requiring IP 54 protection may require additional sealing measures beyond seals provided with the brake - Refer to Installation \& Service Instruction sheets
Parts List: P/N 8-078-906-04
Installation and Service: P/N 8-078-905-60

[^2]Enclosure Material: Stamped Steel Housing, Cast Iron Endplate

Enclosure Protection: IP 23, 54 \& 55 (formerly referred to by Stearns as NEMA 2, 4 \& 4X*) * BISSC Certified
Release Type: Knob, Maintained with Automatic Reset
Mounting: Fanguard-mounted brakes requiring IP 54 or IP 55 protection may require additional sealing measures beyond seals provided with the brake - Refer to Installation \& Service Instruction sheets.
Installation and Service:
P/N 8-078-905-60
Parts List: P/N 8-078-906-05
Modifications: Pages 54-63

## Unit Pricing (Discount Symbol B4)

## Mounting Face: NEMA 182TC - 256TC/UC

## The $87, \mathrm{X} 00^{* *}$ Series have the following design features:

- Self-Adjusting Design
- Splined Hub
- Lead Wire Length: 24 inches
- Maximum Speed:

Horizontal 4000 rpm
Vertical 3600 rpm (modification required for vertical mounting), see SAB Modification Section.

- Coil Insulation: Standard Class B Optional

Class H (Class H standard
on 87,800 )

- Certified: CSA File LR-6254
- ABS Type Approval Certified
** Does not include 87,300 and 87,700 Series brakes.

(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with $50 \%$ duty cycle. Does not relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Derate thermal capacity by $25 \%$ for vertical mounting. Refer to Selection Procedure Section.
87,800 Thermal capacity is $14 \mathrm{hp}-\mathrm{sec} / \mathrm{min}$ ( 174 watts).

Maximum allowable bore 1.875 (maximum shaft length
not to exceed end of hub).
For thru-shaft applications 1.625 is maximum.
*These bores are non-standard.
Add $\$ 250.00$ to list price.
**Keyseats made to ANSI B17.1 standard.

## Direct Current

| Character | Voltage |
| :---: | :---: |
| T | 12 |
| U | 24 |
| V | 36 |
| W | 48 |
| X | 95 |
| Y | 115 |
| Z | 230 |

Consult factory if other DC
voltage is needed.

> Modifications are availablesee SAB Modification Section

Dimensional drawings are on the pages following.

## 8.5" AK, 7.25" AJ

Static Torque: 6 through $105 \mathrm{lb}-\mathrm{ft}$
Enclosure Material: IP 23 - Sheet Metal Housing, Aluminum Endplate. IP 54 \& 55 - Cast Iron Housing and Endplate. IP 54 \& 55 also available in sheet metal housing, aluminum endplate. IP 56 - Cast iron housing and endplate.
Enclosure Protection: IP 23, 5455 (formerly referred to as NEMA 2, 4 \& 4X* respectively) \& IP 56. *BISSC Certified
Release Type: Pull Release Knob, maintained with automatic reset. Vertical above IP 54 \& 55 supplied with side manual release lever; and all Cast Iron IP 55 brakes supplied with side manual release lever.
Installation, Service and Parts List: P/N 8-078-928-01 Rev. B brakes
Mounting: Horizontal, unless modified for vertical. Vertical mounting is defined as $15^{\circ}$ or more from horizontal. Vertical above requires modification. Vertical below requires modification on $50-105 \mathrm{lb}$-ft brakes. Vertical above IP $54 / 55$ includes side manual release. See SAB Modification Section for list price adders.
Fanguard-mounted brakes requiring IP 54 or IP 55 protection may require additional sealing measures beyond seals provided with the brake - Refer to Installation \& Service Instruction sheets.
Specifications including bore sizes/voltages: Page 17
Modifications: Pages 54-63 Including New Manual Adjust Option
Outline Drawing for 1-087-0X2 IP 54 \& 55

Outline Drawing for 1-087-0X1 and 1-087-0X4 Sheet Metal Housing, Aluminum Endplate IP 23, 54 \& 55

Static Torque: 50 through $125 \mathrm{lb-ft}$
Enclosure Material: IP 23 - Sheet Metal Housing, Cast Iron Endplate. IP 54 - Cast Iron Housing and Endplate
Release Type: Knob, maintained with automatic reset. Vertical above IP 54 supplied with side release lever.
Enclosure Protection: IP 23 \& 54 (formerly referred to by Stearns as NEMA Type 2 \& 4, respectively.
Installation, Service and Parts List: P/N 8-078-928-01 Rev. B brakes

Mounting: Horizontal, unless modified for vertical. Vertical mounting is defined as $15^{\circ}$ or more from horizontal. Vertical above and vertical below require modification. Vertical above NEMA 4/4X includes side manual release. See SAB Modification Section for detail and list price adders.
Fanguard mounted brakes requiring IP 54 protection may require additional sealing measures beyond seals provided with the brake Refer to Installation and Service Instruction sheets.
Specifications including bore sizes/voltages: Page 17
Modifications: Pages 54-63 Including New Manual Adjust Option

* Hub location

Dimensions for estimating only. For installation purposes request certified prints.

* Subtract $\$ 45.00$ for brake ordered less hub. ${ }^{1}$ These model numbers and list prices include non-standard friction discs. For high inertia or overhauling loads, it is recommended that 81,000 or 82,000 series brakes be used, as these brakes have substantially higher thermal capacities (50\% higher for 81,000 series and $150 \%$ higher for 82,000 series).

(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with $50 \%$ duty cycle. Does not relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ stop time of one second or less, with no heat absorbed from motor. Refer to "Selection Procedure Section. Derate thermal capacity by $25 \%$ for vertical mounting

## Ordering and Identification Information

The following example and tables provide information for selecting the appropriate three-letter suffix when ordering a Stearns Brake.

Example of a complete part number, Series 81,000:
1-081-011-02-NLF - Lead wire position
(internal and external, left and right)
460 Vac
2-1/8 bore and $1 / 2 \times 1 / 4$ keyway

Current Ratings (amperes)

| CoilSize | Frequency | Voltage | Current |  |
| :---: | :---: | :---: | :---: | :---: |

(1) New! 9th digit indicates aluminum or cast iron housing 2 = Cast Iron
3 = Aluminum: Add . 38 " to "A" dimension
(2) Subtract $\$ 100.00$ for brake ordered less hub.
(3) Subtract 21 lbs . for aluminum housing. Foot mounting adds $40 \mathrm{lbs}(18.2 \mathrm{~kg})$ to weight.

## Motor Frame Adapters

WARNING! Before selecting an adapter to mount a brake on a larger motor frame, the torque and thermal capacity required by the application should be determined as shown in the "Selection Procedure" section. A larger motor may indicate a requirement for greater thermal capacity than the brake is designed for. The brake selection must be matched to the motor and application requirements, before use of an adapter is considered.

| To Adapt to NEMA Frame Size | AK Dim. | Reg. No. | Adapter Stock Number | Additional Shaft Length |

## Motor Frame Adapters

WARNING! Before selecting an adapter to mount a brake on a larger motor frame, the torque and thermal capacity required by the application should be determined as shown in the Selection Procedure section. A larger motor may indicate a requirement for greater thermal capacity than the brake is designed for. The brake selection must be matched to the motor and application requirements, before use of an adapter is considered.

| To Adapt <br> to NEMA <br> Frame Size | AK <br> Dim. | Reg. <br> in <br> No. | Adapter <br> Stock <br> Number | Additional <br> Shaft <br> Length <br> Required |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |

| Z | 230 |

Contact factory if other
DC voltage is needed.
*Keyseats made to ANSI B17.1 standard
Single voltage coils only dual voltage coils not allowed

Enclosures for standard Stearns disc brakes are designed to prevent accidental contact with the internal mechanism while keeping contaminants from the operating parts. Many installations, however, require additional protection due to the presence of explosive gases or ignitable dusts in the atmosphere. Hazardous locations are defined in the National Electrical Code (NEC) and designated by Class, Division and Group. For a better understanding of hazardous locations, or for definitions of hazardous location terminology, please refer to: http://www.ul.com/global/eng/pages/ offerings/services/hazardouslocations/.

- Class I - Locations where the atmosphere may contain flammable gases or vapors in explosive or ignitable concentrations. An electric disc brake for Class I locations must be built in such a manner that any ignition of gases or vapors within the brake will not result in rupture of the enclosure or allow a flame or spark to travel from within the brake to the surrounding hazardous atmosphere.
- Class II - Locations with combustible dust in suspension in the atmosphere. An electric disc brake for Class II locations must be enclosed in a manner which precludes entry of ignitable dusts or exit of any arcs, sparks, or hot gases which may cause ignition of dusts suspended in the surrounding atmosphere or accumulated on the enclosure. The exterior surface temperature of the brake enclosure must be limited so that it can function at its maximum-rated duty cycle without causing dehydration or carbonization of dust that accumulates on the enclosure.
- Divisions - Each hazardous-location Class is also divided into two Divisions, 1 and 2. Division 1 is a normally hazardous location. Division 2 is normally not hazardous. Division 1 brakes can be used in both types of locations. Division 2 can be used in Division 2 environments ONLY.
- Groups - Class I gases and vapors are listed in four Groups A, B, C and D, based on specific properties such as maximum explosion pressure and ignition temperature. Class II airborne dusts are listed in three Groups: E, F, and $G$. The dust properties considered include thermal and electrical conductivity and ignition temperature.

## Selection

When specifying a Stearns hazardouslocation disc brake, the Class and Group designations of the hazardous atmosphere and its ignition temperature must be known. The selection table gives the hazardous atmospheres that Stearns brakes are suitable for, along with the brake's maximum operating
temperature. For more information on hazardous location responsibilities, see: http://www.ul.com/global/eng/pages/ offerings/services/hazardouslocations/
Step 1 - Determine the Class and Group designation of the hazardous atmosphere.
Step 2 - For Class I hazardous substances, determine the ignition temperature of the explosive gas or vapor. Select a brake listed for the appropriate group with a maximum external surface temperature that does not exceed the ignition temperature of the explosive gas or vapor.
Step 3 - For Class II hazardous substances, select a brake listed for the appropriate group.
Ignition temperatures of Combustible Dusts may be found in NFPA publication NFPA 499 Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas. Ignition temperatures of Flammable Liquids, Gases and Vapors may be found in NFPA publication NFPA 497 Recommended Practice for the Classification of Flammable Liquids, Gases and Vapors and of Hazardous (Classified) locations for Electrical Installations in Chemical Process Areas.

## Brake Labels and Listing

Stearns brakes for use in hazardous locations are marked to show the Class, Group, and maximum Class II operating temperature (in a $40^{\circ} \mathrm{C}$ ambient) of the brake enclosure, as well as the minimum Class I ignition temperature of the gases or vapors to which they can be exposed.
Generally, compliance with the NEC is demonstrated by UL Listing of the product in Underwriters Laboratories Hazardous Location Equipment Directory. A label displaying the UL Listing mark and required rating information will be found on each Stearns brake to confirm the Listing.

In Canada, the Canadian Standards Association (CSA) is an organization with the responsibility to publish and administer national electrical standards as well as to test and certify electrical products. The CUL or CSA monogram will be found on Stearns hazardous-location brakes sold in Canada to confirm certification.

Stearns motor-mounted, hazardouslocation electric disc brakes are Listed only when mounted directly to a Listed hazardous-location motor of the same Class and Group at the motor manufacturer's facility, and where the combination has been accepted by UL. This procedure completes the explosionproof assembly of the brake. However, foot-mounted Listed hazardouslocation disc brakes are also available for coupling to a motor, and may be installed by anyone.
These brakes are listed by UL (Underwriters Laboratories, Inc.,) for use in certain locations classified as hazardous. Installation and servicing must be in compliance with all existing local safety codes. All wiring and electrical connections must comply with the National Electric Code (NEC) and local electrical codes in effect at the time. For additional information see the Underwriters Laboratories (UL) website http://www.ul.com/hazloc/codes/html.
HazLoc inspection authorities are responsible for verifying and authorizing the use of suitably designed, manufactured and installed HazLoc equipment. When questions arise always consult the local Authority Having Jurisdiction (AHJ) for directions and approvals.

## Hazardous-Location Brake Enclosures

Division 1, hazardous location brakes are typically provided with machined components, without gaskets. Series 65300 brakes can be provided with gaskets to meet IP 55, 56 or Type 4 enclosure protection. Series 87300 brakes can be provided with gaskets to meet IP 55, 56 or 57 enclosure protection. Series 82300 can be provided with IP 56 enclosure protection. All Division 1 enclosures prevent flame propagation to the outside atmosphere through tortuous flame paths having controlled clearances. If the brake is used in a high humidity or low temperature environment, internal electric heaters should be used.
Division 2 hazardous location brakes are provided with an IP 55 enclosure. Heater and proximity switch options are limited to Division 2, Class II brakes.

A major design requirement of hazardous-location brakes is to limit exterior surface temperature. The surface temperature of the enclosure must not exceed a specified limit as a result of heat energy created in stopping the motor and load. This NEC restriction on the exterior surface temperature limits the hazardous-location brake's ability to dissipate heat, resulting in less thermal capacity than a comparable brake with a standard or dust-tight, waterproof enclosure.

THEREFORE, HAZARDOUS-LOCATION BRAKES ARE INTENDED ESSENTIALLY FOR NON-CYCLIC OR HOLDING PURPOSES, BUT MAY BE USED FOR STOPPING LIGHT INERTIAL LOADS.

Hazardous Location Brake Selection Table

| Classification |  | Minimum Auto-Ignition Temperature of Atmosphere | Minimum Layer or Cloud Ignition Temperature | T Code | Brake Series Division 1 | Brake Series Division 2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Class | Group |  |  |  |  |  |
| 1 | A | $160^{\circ} \mathrm{C} / 320^{\circ} \mathrm{F}$ |  | T3C |  | 56800, 87800 |
|  | B | $160^{\circ} \mathrm{C} / 320^{\circ} \mathrm{F}$ |  | T3C |  | 56800, 87800 |
|  | C | $100^{\circ} \mathrm{C} / 212^{\circ} \mathrm{F}$ |  | T5 | 87300 |  |
|  |  | $160^{\circ} \mathrm{C} / 320^{\circ} \mathrm{F}$ |  | T3C |  | 56800, 87800 |
|  |  | $180^{\circ} \mathrm{C} / 356^{\circ} \mathrm{F}$ |  | T3A | 65300, 82300 |  |
|  | D | $100^{\circ} \mathrm{C} / 212^{\circ} \mathrm{F}$ |  | T5 | 87300 |  |
|  |  | $160^{\circ} \mathrm{C} / 320^{\circ} \mathrm{F}$ |  | T3C |  | 56800, 87800 |
|  |  | $180^{\circ} \mathrm{C} / 356^{\circ} \mathrm{F}$ |  | T3A | 65300, 82300 |  |
| 11 | E |  | $100^{\circ} \mathrm{C} / 212^{\circ} \mathrm{F}$ | T5 | 87300 |  |
|  |  |  | $165^{\circ} \mathrm{C} / 329^{\circ} \mathrm{F}$ | T3B | 65300*, 82300* |  |
|  | F |  | $100^{\circ} \mathrm{C} / 212^{\circ} \mathrm{F}$ | T5 | 87300 |  |
|  |  |  | $160^{\circ} \mathrm{C} / 320^{\circ} \mathrm{F}$ | T3C |  | 56800, 87800 |
|  |  |  | $165^{\circ} \mathrm{C} / 329^{\circ} \mathrm{F}$ | T3B |  | 87800 |
|  |  |  | $165^{\circ} \mathrm{C} / 329^{\circ} \mathrm{F}$ | T3B | 65300, 82300 |  |
|  | G |  | $100^{\circ} \mathrm{C} / 212^{\circ} \mathrm{F}$ | T5 | 87300 |  |
|  |  |  | $160^{\circ} \mathrm{C} / 320^{\circ} \mathrm{F}$ | T3C |  | 56800, 87800 |
|  |  |  | $165^{\circ} \mathrm{C} / 329^{\circ} \mathrm{F}$ | T3B |  | 87800 |
|  |  |  | $165^{\circ} \mathrm{C} / 329^{\circ} \mathrm{F}$ | T3B | 65300, 82300 |  |
| NOTE: Models with asterisk (*) group E available in select models only, consult factory. |  |  |  |  |  |  |

*Series 65,300-07 (New Design Close Coupled) and 65,300-09 (Fan Guard Mount) are Class I Group C and D, Class II Group F and G only
Maximum exterior surface temperature is based on operation in an ambient of $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$.

## 65,300 and $87,300 \& 82,300$

These brakes rely on a thermostat switch wired to the motor control circuit to limit the brake's enclosure surface temperature.
Refer to the circuit diagram. If the brake begins to overheat, the thermostat TSW2 switch will open and interrupt the motor starter and brake solenoid current, causing the brake to set. A second thermostat TSW1 will close on Series $65, \mathrm{X00}$, or will open on Series $87,300^{* *}$ and $82,300^{* *}$ brakes. The TSW1 switch can be used to actuate alarm or warning light. This switch actuates at a lower temperature than TSW2, and will alert the equipment operator of an impending thermal overload.

## Circuit Diagram

**TSW1 is optional on 87,300 and 82,300 series brakes.

## Division I Hazardous Location

 Mounting Face: NEMA 56C, 143TC and 145TC 4.5" AK, 5.88" AJHazardous-location brakes are intended essentially for non-cyclic or holding purposes, but may be used for stopping light inertial loads.

## 1-065-3XX-05 Series

Mounting Requirements: 1-065-3XX-05 Series Hazardous Location Motor Mounted Brake is used for mounting close coupled (directly) to the motor end bell. If the brake is to be mounted to a motor fan guard, or if a motor frame adapter is incorporated, it is recommended that Series 1-065-3XX-09 be used, as it provides additional bearing support for the longer shaft that is required. The acceptability of the brake and motor combination must be determined by Underwriters Laboratories Inc.
Certified: Series 65,300-05 (1-065-3XX-05) USL/CNL, File E-14893, for Class I, Group C and D and Class II, Group E, F and G
Class I, Zone 1, Group IIA and IIB
Enclosure Protection: IP 23 and Hazardous Location NEMA 7, 9
Dimensions for estimating only.
Installation and Service Instructions: P/N 8-078-925-13 Rev. C \& D brakes
For installation purposes request certified prints.
Parts List: P/N 8-078-913-13 Rev. C \& D brakes

## 1-065-3XX-07 Series

Mounting Requirements: 1-065-3XX-07 Series Hazardous Location Motor Mounted Brake is used for mounting close coupled (directly) to the motor end bell. If the brake is to be mounted to a motor fan guard, or if a motor frame adapter is incorporated, it is recommended that Series 1-065-3XX-09 be used, as it provides additional bearing support for the longer shaft that is required. The acceptability of the brake and motor combination must be determined by Underwriters Laboratories Inc.
Certified: Series 65,300-07 (1-065-3XX-07) USL/CNL Listed, File E-14893, for Class I, Group C and D and Class II, Group F and G Class I, Zone 1, Group IIA and IIB
Enclosure Protection: IP 56, and Hazardous Location NEMA 7, 9, UL Type 4
Installation and Service Instructions: P/N 8-078-925-09
Parts List: P/N 8-078-913-09

Note: 65,300 Series Close-Coupled Brakes (-07) must be mounted directly to motor endbell.

1-065-3XX-09 Fan-Guard Mount IP 23
Hazardous location NEMA 7, 9

| Model Number | Static <br> Torque Ib-ft <br> $(\mathbf{N m})$ | List Price | Weight <br> lbs <br> $(\mathrm{kg})$ |
| :---: | :---: | :---: | :---: |

## 1-065-3XX-09 Series

Mounting Requirements: 1-065-3X1-09 Series Hazardous Location Motor Mounted Brake is recommended for mounting to a motor fan guard or for use with a motor frame adapter. The acceptability of the brake and motor combination must be determined by Underwriters Laboratories Inc.

Enclosure Protection: IP 23 and Hazardous Location NEMA 7, 9
Certified: 65,300-09 (1-065-3XX-09)
USL/CNL File E-14893, for Class I, Group C and D and Class II, Group F and G
Class I, Zone 1, Group IIA and IIB
Installation and Service Instructions: P/N 8-078-925-09
Parts List: P/N 8-078-913-09
Dimensions for estimating only.
For installation purposes request certified prints.

Series 87,300-00 and 87,300-02
(1-087-3XX) Motor Mounted Division I Hazardous Location Mounting Face: NEMA 182TC, 184TC, 213TC, 215TC, 254TC, 256TC 8.5" AK, 7.25" AJ

Static Torque: 10 through $105 \mathrm{lb}-\mathrm{ft}$ Enclosure Material: Cast Iron
Release Type: Knob
Modification required for vertical above mounting. For vertical below, modification required on $50-105 \mathrm{lb}-\mathrm{ft}$. See SAB
Modification Section for list price adders.

- Self-Adjusting Design BACK TO TABLE OF CONTENTS
- Epoxy Encapsulated Coil Construction, with Class H Insulation
- NC Thermostat
- Spring-Set Electrically Released
- Lead Wire Length: 36 inches
- Maximum Speed: Horizontal 4000 rpm, Vertical 3000 rpm
- ABS Type Approval Certified.

Brake set and release times in milliseconds, when brake and motor are switched separately (for T1/T2 definitions, see page 101):

| Static Torque | Coil Size | T1 | T2 |
| :---: | :---: | :---: | :---: |
| $10,15,25,50$ | $5 \& 6$ | 42 | 20 |
| $35,75,105$ | 8 | 48 | 20 |

Hazardous-location brakes are intended essentially for non-cyclic or holding purposes, but may be used for stopping light inertial loads.

## Series 87,300-00

Enclosure Protection: IP 23, IP 55 or IP 57. For IP 55 and IP 57 protection, the brake must be mounted close coupled to the motor end bell (a motor frame adapter may be included). Hazardous Location NEMA 7, 9.
Mounting Requirements: 1-087-3XX-00 Series Hazardous Location Motor Mounted Brake is recommended for mounting close coupled (directly) to the motor end bell. If the brake is to be mounted to a motor fan guard, or if a motor frame adapter is incorporated, it is recommended that Series $1-087-3 X X-02$ be used, as it provides additional bearing support for the longer shaft that is required. The acceptability of the brake and motor combination must be determined by Underwriters Laboratories Inc.
Certified: UL Listed, File E-14893 for Class I, Group C and D and Class II, Group F and G.
CSA Certified, File LR-9584 for Class I, Group C and D, and Class II, Group E, F and G.
Installation and Service Instructions: P/N 8-078-927-03
Dimensions for estimating only. For installation
Parts List: P/N 8-078-917-03 for IP 23 8-078-917-23 for IP 55 purposes request certified prints.

Static Torque: 10 through $105 \mathrm{lb-ft}$
Enclosure Material: Cast Iron

## Release Type: Knob

Enclosure Protection: IP 23 and Hazardous Location NEMA 7 and NEMA 9 Installation and Service Instructions: P/N 8-078-927-03
Parts List: P/N 8-078-917-03

## Mounting Requirements:

1-087-3X2-00 Series Hazardous Location Foot Mounted Brake does not require assembly to the motor to complete the hazardous location enclosure.

Hazardous-location brakes are intended essentially for non-cyclic or holding purposes, but may be used for stopping light inertial loads.

- Self-Adjusting Design
- Epoxy Encapsulated Coil Construction, with Class H Insulation
- NC Thermostat
- Spring-Set Electrically Released
- Lead Wire Length: 36 inches
- Maximum Speed: Horizontal 4000 rpm
- Certified: UL Listed, File E-14893 for Class I, Group C and D and Class II, Group F and G. CSA Certified, File LR-9584 for Class I, Group C and D, and Class II, Group E, F and G.
- ABS Type Approval Certified

Brake set and release times in milliseconds, when brake and motor are switched separately (for T1/T2 definitions, see page 101):

| Static Torque | Coil Size | T1 | T2 |
| :---: | :---: | :---: | :---: |
| $10,15,25,50$ | $5 \& 6$ | 42 | 20 |
| $35,75,105$ | 8 | 48 | 20 |

Dimensions for estimating only. For installation purposes request certified prints.

*Keyseats made to ANSI B17.1 standard

## Specifications and Ordering Information

for Series 87,300-00 (1-087-3XX-00) and Series 87,300-02 (1-087-3XX-02)

## Engineering Specifications

| Nominal <br> Static <br> Torque | No. of <br> Friction <br> Discs | Coil <br> Size | (lb-ft) <br> (Nm) | Solenoid <br> Cycle <br> Rate(1) | Thermal <br> Capacity(2) |
| :---: | :---: | :---: | :---: | :---: | :---: | Inertia (Wk²)

(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with $50 \%$ duty cycle. Does not relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Derate thermal capacity by $25 \%$ for vertical mounting. Refer to Selection Procedure Section.

## Motor Frame Adapters

WARNING! Before selecting an adapter to mount a brake on a larger motor frame, the torque and thermal capacity required by the application should be determined as shown in the "Selection Procedure" section. A larger motor may indicate a requirement for greater thermal capacity than the brake is designed for. The brake selection must be matched to the motor and application requirements, before use of an adapter is considered.
Consult the factory.

## Ordering and Identification Information

The following example and tables provide information for selecting the appropriate three-letter suffix when ordering a Stearns Brake.
Example of a complete part number: 1-087-341-02-ELC __ Lead wire position (external right)
 460 Vac $1-1 / 8$ bore and $1 / 4 \times 1 / 8$ keyway (does not apply to foot mounted brake) Series -02

## 1-082-3XX-00 Series Motor Mounted Brake

Mounting Requirements: 1-082-3XX-00 Series Hazardous Location Motor Mounted Brake is used for mounting close coupled (directly) to the motor end bell. If brake is to be mounted to a motor fan guard, or if a motor frame adapter is incorporated, please contact the factory for information on Series 1-082-3X4-02, as it provides additional bearing support for the longer shaft that is required. The acceptability of the brake and motor combination must be determined by Underwriters Laboratories Inc.
Enclosure Protection: IP 56, and Hazardous Location NEMA 7, 9

| Model Number | Torque | C | SL |
| :---: | :---: | :---: | :---: |
| $1-082-31 \mathrm{X}-00$ | $125 \mathrm{lb}-\mathrm{ft}$ | 2.79 | 3.03 |
| $1-082-32 \mathrm{X}-00$ | $175 \mathrm{lb}-\mathrm{ft}$ | $(70.87)$ | $(76.96)$ |
| $1-082-33 \mathrm{X}-00$ | $230 \mathrm{lb}-\mathrm{ft}$ | 3.29 | 3.53 |
| $1-082-34 \mathrm{X}-00$ | $330 \mathrm{lb}-\mathrm{ft}$ | $(83.57)$ | $(89.66)$ |

> Above drawing is for motor mounted brake only. For fan guard mounted brake (1-082-3X4-02 series), request Stearns drawing no. 1-082-304-2D.

## 1-082-3X6-00 Series Foot Mounted Brake

Mounting Requirements: 1-082-3X6-00 Series Hazardous Location Foot Mounted Brake does not require assembly to the motor to complete the hazardous location enclosure.
Enclosure Protection: IP 23 and Hazardous Location NEMA 7, 9

Hazardous-location brakes are intended essentially for non-cyclic or holding purposes, but may be used for stopping light inertial loads.
Dimensions for estimating only. For installation purposes, request certified prints.

*Keyseats made to ANSI B17.1 standard

Static Torque: 1.5 through $25 \mathrm{lb}-\mathrm{ft}$
Enclosure Material: Cast Iron
Release Type: Side Lever, maintained with auto reset
Enclosure Protection: IP 54
Certified: UL Listed, File E 14893 for Class 1, Division 2, Groups A, B, C, D, and Class II, Division 2, Groups F and G
Mounting Requirements: 1-056-8X2 Series Hazardous Location Motor Mounted Brake is recommended for mounting close coupled to the motor end bell. The acceptability of the brake and motor combination must be determined by Underwriters Laboratory.
Universal Mounting: Through $15 \mathrm{lb}-\mathrm{ft}$. 20 and $25 \mathrm{lb}-\mathrm{ft}$. supplied with springs for vertical modification.

Epoxy Encapsulated Coil Construction, with Class H Insulation

## NC Thermostat

Maximum speed:
Horizontal 5000 rpm Vertical 3600 rpm
Installation, Service and Parts List: P/N 8-078-905-18
ABS Type Approval Certified
Brake set and release times in milliseconds, when brake and motor are switched separately (for T1/T2 definitions, see page 101):

| Static <br> Torque | Coil Size | T1 | T2 |
| :---: | :---: | :---: | :---: |
| $1.5-25$ | $4, \mathrm{~K} 4$, <br> $\mathrm{K} 4+, \mathrm{M} 4+$ | 25 | 14 |

Dimensions for estimating only. For installation purposes request certified prints.

## Motor Frame Adapters

WARNING! Before selecting an adapter to mount a brake on a larger motor frame, the torque and thermal capacity required by the application should be determined as shown in the "Selection Procedure" section. A larger motor may indicate a requirement for greater thermal capacity than the brake is designed for. The brake selection must be matched to the motor and application
requirements, before use of an adapter is considered.

(1) Maximum solenoid cycle rate is based on ambient temperature of $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right.$ ) with $50 \%$ duty cycle. Does relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Derate thermal capacity by $25 \%$ for vertical mounting. Refer to Selection Procedure Section

## Ordering and Identification Information

The following example and tables provide information for selecting the appropriate three-letter suffix when ordering a Stearns Brake.
Example of a complete part number: 1-056-832-00-BFF___Lead wire position (internal and external, left and right)

230 Vac
$5 / 8$ bore and $3 / 16 \times 3 / 32$ keyway

| Character | Bore <br> (in.) | Keyway** <br> (in. x in.) |
| :---: | :---: | :---: |
| $\mathrm{A}^{*}$ | $5 / 8$ | $1 / 8 \times 1 / 16$ |
| B | $5 / 8$ | $3 / 16 \times 3 / 32$ |
| C | $3 / 4$ | $3 / 16 \times 3 / 32$ |
| D | $7 / 8$ | $3 / 16 \times 3 / 32$ |
| E | $1-1 / 8$ | $1 / 4 \times 1 / 8$ |
| $\mathrm{~F}^{*}$ | $1-1 / 4$ | $1 / 4 \times 1 / 8$ |
| K | $1 / 2$ | $1 / 8 \times 1 / 16$ |
| $\mathrm{~L}^{*}$ | 1 | $1 / 4 \times 1 / 8$ |
| $\mathrm{~N}^{*}$ | $9 / 16$ | $1 / 8 \times 1 / 16$ |
| $\mathrm{O}^{*}$ | $11 / 16$ | $3 / 16 \times 3 / 32$ |
| $\mathrm{P}^{*}$ | $1-1 / 6$ | $1 / 4 \times 1 / 8$ |
| $\mathrm{R}^{*}$ | $13 / 16$ | $3 / 16 \times 3 / 32$ |
| $\mathrm{~S}^{*}$ | $15 / 16$ | $1 / 4 \times 1 / 8$ |

Maximum allowable bore 1.25 .
For thru-shaft applications, . 875
is maximum.
*These bores are non-standard. Add $\$ 225.00$ to list price.
*Keyseats made to ANSI B17.1 standard.

Standard AC Voltage Ratings

| Character | Voltage | Hz |
| :---: | :---: | :---: |
| B | 115 | 60 |
| D | 110 | 50 |
| E | 200 | 60 |
| F | 230 | 60 |
|  | 190 | 50 |
| H | 220 | 50 |
| L | 460 | 60 |
| 380 | 50 |  |
| M | 415 | 50 |
| N | 575 | 60 |
| O | $110 / 220$ | 50 |
| P | 115 | 60 |
| Q | 230 |  |
| R | $230 / 460$ | 60 |

DC voltages not available.

Space heater not available.

## Division 2 Hazardous Location

Mounting Face: NEMA 182TC 184TC, 213TC, 215TC, 254TC, 254UC,

256TC and 256UC
8.5" AK, 7.25" AJ

Static Torque: 6 through $105 \mathrm{lb}-\mathrm{ft}$ Enclosure Material: Cast Iron Release Type: Knob
Enclosure Protection: IP 54 Division 2 Hazardous Duty
Certified: UL Listed, File E-14893.
For Hazardous Location Classification, see Dimensional Data below.
Mounting Requirements: 1-87-8XX Series Hazardous Location Motor Mounted Brake is recommended for mounting close coupled to the motor end bell. The acceptability of the brake and motor combination must be determined by Underwriters Laboratory.
Modification required for vertical above mounting. For vertical below, modification required on $50-105 \mathrm{lb}-\mathrm{ft}$.

Epoxy Encapsulated Coil Construction, with Class H Insulation

## NC Thermostat

Maximum speed:
Horizontal 4000 rpm
Vertical 3000 rpm
ABS Type Approval Certified
Installation, Service \& Parts List: P/N 8-078-927-08
Brake set and release times, when brake and motor are switched separately (for T1/T2 definitions, see page 101):

| Static Torque | Coil Size | T1 | T2 |
| :---: | :---: | :---: | :---: |
| $10,15,25,50$ | $5 \& 6$ | 42 | 20 |
| $35,75,105$ | 8 | 48 | 20 |

1/8 pipe tap - drain hole for horiz.
\& vertical below mounting

Motor Frame Adapters:
WARNING! Before selecting an adapter to mount a brake on a larger motor frame, the torque and thermal capacity required by the application should be determined as shown in the "Selection Procedure" section. A larger motor may indicate a requirement for greater thermal capacity than the brake is designed for. The brake selection must be matched to the motor and application requirements, before use of an adapter is considered.

(1) Maximum solenoid cycle rate is based on ambient temperature of $104^{\circ} \mathrm{F}$ $\left(40^{\circ} \mathrm{C}\right.$ ) with $50 \%$ duty cycle. Does relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $104^{\circ}\left(40^{\circ} \mathrm{C}\right)$, stop time of ne second or less, with no heat absorbed from motor. Derate thermal capacity by $25 \%$ for vertical mounting. Refer to Selection Procedure Section.

## Ordering and Identification Information

The following example and tables provide information for selecting the appropriate three-letter suffix when ordering a Stearns Brake.

Example of a complete part number:
1-087-832-01-ELF __ Lead wire position (internal and

Optional Space Heater for Class II Brakes only
4.5" AK, 5.88" AJ

Static Torque: 1.5 through $25 \mathrm{lb}-\mathrm{ft}$
Enclosure Material: IP 23, 54 \& 55 Die Cast Aluminum; IP 56 Stainless Steel
Release Type: Knob, Maintained with automatic reset
Enclosure Protection: IP 23 \& 54 (formerly referred to by Stearns as NEMA Type 2 \& 4 respectively).

IP 55 \& 56 (formerly referred to by Stearns as NEMA Type 4X BISSC Certified \& Type 4X stainless steel enclosure, respectively).

- ABS Type Approval Certified
- Spring-Set Electrically Released
- Adjustable Torque
- Manual Release Knob, Maintained with Automatic Reset
- Manual Wear Adjustment
Note: 56,700 Series mounts between
C-Face motor and reducer. Do not apply overhung
load to brake output shaft.
Installation and Service:
P/N 8-078-905-67
Parts List: P/N 8-078-906-07
Modifications: Pages 54-63
Universal Mounting: Through 15 lb -ft.
20 and 25 lb -ft. supplied with springs for vertical modification.
Brake set and release times in milliseconds, when brake and motor are switched separately (for T1/T2 definitions, see page 101)

(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with $50 \%$ duty cycle. Does not relate to brake cycle rate (see Thermal Capacity).
2) Thermal capacity rating is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Refer to Selection Procedure Section.

## Ordering and Identification Information

The following example and tables provide information for selecting the appropriate three-letter suffix when ordering a Stearns Brake.
Example of a complete part number:
1-056-731-05-_FF __ Lead wire position (internal and external, left and right)

Hub Bore, Shaft and Keyway Sizes

| 9th Digit of <br> Model No. | Bore Dia. <br> (X) | Keyway** | Shaft Dia. <br> (U) | Keyway** |
| :---: | :---: | :---: | :---: | :---: |
| 5 | .625 | $.19 \times .09$ | .625 | $.19 \times .09$ |
| 7 | .875 | $.19 \times .09$ | .875 | $.19 \times .09$ |
| $8^{*}$ | .875 with <br> sleeve to <br> convert <br> to 625 | $.19 \times .09$ | .625 with <br> sleeve to <br> convert <br> to 875 | $.19 \times .09$ |

*One sleeve provided in each brake.
**Keyseats made to ANSI B17.1 standard.

Standard AC
Voltage Ratings

| Character | Voltage | $\mathbf{H z}$ |
| :---: | :---: | :---: |
| B | 115 | 60 |
| D | 110 | 50 |
| E | 200 | 60 |
| F | 230 | 60 |
| H | 220 | 50 |
| L | 460 | 60 |
| M | 480 | 50 |
| N | 575 | 50 |
| O | $110 / 220$ | 50 |
| P | $115 / 208$ |  |
| 230 | 60 |  |
| Q | 2308 | $230 / 460$ |
| R | $200 / 380$ | 50 |

Direct Current

| Character | Voltage |
| :---: | :---: |
| T | 12 |
| U | 24 |
| V | 36 |
| W | 48 |
| X | 95 |
| Y | 115 |
| Z | 230 |

Consult factory if other DC voltage is needed

Mounting Face: NEMA 182TC 184TC,
213TC, 215TC, 254TC, 254UC, 256TC and 256UC Double C-Face Coupler

8.5" AK, 7.25" AJ

Static Torque: 6 through $105 \mathrm{lb}-\mathrm{ft}$
Enclosure Material:
Aluminum Housing, Cast Iron Endplate
Release Type: Side Lever, Maintained with automatic reset
Enclosure Protection: IP 23,54 \& 55 (formerly referred to by Stearns as NEMA 2, 4 \& 4X BISSC Certified, respectively).
Installation and Service Instructions:
P/N 8-078-927-27 Rev. B \& C
Parts List: P/N 8-078-917-57 Rev. B
P/N 8-078-917-67 Rev. C
Modifications: Pages 54-63

Note: 87,700 Series mounts between C-Face motor and reducer. Do not apply overhung load to brake output shaft.
Modification required for vertical above mounting. For vertical below, modification required on $50-105 \mathrm{lb}-\mathrm{ft}$. See SAB Modifications for list price adders.

- ABS Type Approval Certified
- Spring-Set Electrically Released
- Self-Adjusting Design
- Maximum Speed: Horizontal 4000 rpm Vertical 3600 rpm
- Certified: CSA File LR-6254

Brake set and release times in milliseconds, when brake and motor are switched separately (for T1/T2 definitions, see page 101):

| Static Torque | Coil Size | T1 | T2 |
| :---: | :---: | :---: | :---: |
| $10,15,25,50$ | $5 \& 6$ | 42 | 20 |
| $35,75,105$ | 8 | 48 | 20 |

(1) Maximum solenoid cycle rate is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ with $50 \%$ duty cycle. Does not relate to brake cycle rate (see Thermal Capacity).
(2) Thermal capacity rating is based on ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$, stop time of one second or less, with no heat absorbed from motor. Derate thermal capacity by 25\% for vertical mounting. Refer to Selection Procedure Section.

A. IEEE 45 compliance nameplate is optional. ABS Certificate SB374021
B. Additional options and modifications are included in the full 12 digit part number
C. IP 56 with side release option available in 1-087-000-K0 \& 1-082-000-K0
D. The maintained release holds the brake in a release condition until the brake is electrically, or manually, re-engaged

The non-maintained ("deadman") release is manually held in the the released condition, re-setting when the force is removed
E. Spring-set, Solenoid with coil \& linkage actuated brake (SAB), AC or DC voltage coil

Spring-set, Armature actuated direct-acting brake (AAB), DC voltage coil
F. Carrier ring friction disc is standard with the 350 \& 360 series and is an option in the SAB brakes
G. Stainless Steel Self-Adjust is standard with the 1-08x-600 and 1-087-M00
H. 1-087: cast aluminum; 1-082: cast iron; 1-086: ductile iron

## Armature-Actuated Brakes

MIL-B-16392C is inactive for new design and is no longer required, except for replacement purposes, per statement issued by Naval Sea Systems Command in June of 2001. The armature-actuated brake (AAB) was designed in consultation with Naval specification authorities as a suitable Commercial off the shelf (COTS) motor brake.

## Series 350

Stearns 1-082-3X4-06 series of electric fail-safe motor brakes are now certified for use in underground mines by the federal Mine Safety and Health Administration (MSHA).
Stearns is the only supplier of MSHA certified motor brakes.
MSHA approves and certifies products for use in underground coal and gassy mines to ensure that they do not cause a fire or explosion.

## Features:

## Fan Guard Mounted

Mounting face: $12.5^{\prime \prime} \mathrm{AK}, 11.0^{\prime \prime} \mathrm{AJ}$
(NEMA 324 and 326 TC, NEMA 364 and
365 TC, NEMA 404 and 405 TC)
Static Torque: 125 through $330 \mathrm{lb}-\mathrm{ft}$
Spring-Set Electrically-Released
Enclosure Material: Cast Iron
Manual Release Type: Side lever, latching with automatic reset when electric power is applied to the brake coil

Enclosure Protection: IP 56
Self-Adjust Design: Automatic adjustment for friction disc wear - to reduce maintenance

## Class H Coil Insulation

## Thermal Cut-Out Switch

Electrical Connections terminate at terminal block

MSHA Certification Number: 18-XPA070006-0

## Options:

- Internal Encoder
- Internal Electric Heater
- Electrical Release Indicator Switch
- Carrier Ring Friction Discs

| $1-082-344-06$ | IP56 | $330(447)$ | $\$ 30,000$ |

## Ordering Information - specify ${ }^{1}$ :

- Model Number
- Bore \& keyway ${ }^{2}$
- Voltage ${ }^{2}$
- Options
- Leadwire packing gland - left or right (looking towards brake mounting face). Note: encoder option requires that the encoder wiring enters the brake from the opposite side of all of the other brake wiring.

1 These brakes need to be purchased from the motor manufacturer, as the required shaft length (dimension "SL" above) is not standard.

2 Refer to Stearns Catalog page 37

Stearns Solenoid Actuated Brakes with Internally Mounted Encoder

## Features

- Available in frame sizes 182TC - 505TC
- All enclosure ratings available, including hazardous location
- Separate conduit exits are provided for the brake and encoder leads, to minimize potential electrical interference
- Choice of popular encoder manufacturers

## Benefits

- Encoder located in protected environment enclosed inside the brake housing
- Simplified encoder mounting - using a hub or shaft-mount encoder - and it's already done!
- Reduced package length - an internal encoder does not add any length to the brake
- Lower installed cost

## Ordering Information

Stearns brakes with internal encoders are purchased through the motor manufacturer, as the required shaft length and diameter are non-standard. An internal encoder is not a retrofit option, like a brake coil, heater or switch. To order the brake motor package, specify the brake model and encoder option from table on following page.

## Encoder Brakes (Con't)

## Stearns Solenoid Actuated Brakes with Internally Mounted Encoder

## Ordering Information

For Stearns Solenoid Actuated Brakes (SABs), with internal encoders -
Specify the complete brake model number and encoder option from the following table.
Contact factory for pricing.
Industrial Locations ${ }^{1}$

| Frame Size | Brake Series | Torque Range (lb-ft) | Encoder Options ${ }^{2}$ | Connector / Cable ${ }^{3}$ | Stearns Drawing No. ${ }^{4}$ |

${ }^{1}$ Brake must be supplied by the motor manufacturer (a longer "stepped-down" motor shaft is required).
${ }^{2}$ Encoders are Optical, 1024 PPR.
${ }^{3}$ Cables are shielded. Lengths are from encoder connector, inside the brake (not from outside of brake housing)
${ }^{4}$ Request this drawing for shaft design requirements
${ }^{5}$ No motor shaft modifications required, beyond the brake requirements for a standard hazardous location brake.
${ }^{6}$ Drawing 1087308D brake model mounts close-coupled to the motor end bell.
For the brake model that mounts to the motor fan guard - with a slinger - refer to drawing 10873052D.
${ }^{7}$ Based on 182 C-frame on accessory end of motor (7-1/4" bold circle).

In addition to the fully enclosed brake with internal encoder options, encoders can be adapted externally to Stearns brakes:

## Information Needed for Modifications

Stearns is dedicated to providing you with the most comprehensive selection of modified spring-set disc brakes on the market today. We have included a list of our more popular modifications complete with descriptions, pictures and graphics when applicable and list price adders along with their representative series. Note that modification list prices are subject to the same discounts as apply to the complete brake assembly.
Below please find examples of how the modifications are called out with a letter in the 8th position of the 12 digit model number. Note that these listings are not complete, but represent our more popular selections. For any special applications and modification requirements not found here, please contact your Stearns representative.
IMPORTANT - The modification letter will appear in the 8th position to call out the modification.

## Examples:

| 1-056-XXX- $X$ |  |
| :---: | :---: |
|  | - 8th position |
| 1-087-XXX- X |  |
|  | - 8th position |
| ${ }^{1-08 X-X X X-~} \mathrm{X}$ |  |
|  | - 8th position |

See specific tables for some of the available options of the series required.
If two or more letter modifications are required, the 8th position of the part number will remain zero and position 10 , 11 and 12 will be assigned by Stearns as a special part number.

## All Series

## M1 Electrical Release Indicator Switch

This switch is used to indicate when the brake is in a released, non-holding position. This mechanism

| Series | List Price Adder |
| :---: | :---: |
| $56, \mathrm{X} 00$ \& 65,300 | $\$ 450.00$ |
| 81,$000 ; 82,000 ; 87, \mathrm{X} 00$ | 450.00 |
| $86, \mathrm{X} 00$ | 900.00 |

Not available on 56,800 or 87,800 Series Brakes.

## M2 Electrical Release Indicator Proximity Switch

Same function as the switch in M1 above; except, M2 uses an electronic proximity sensor.

| Series | List Price <br> Adder |
| :---: | :---: |
| 81,000 |  |
| 82,000 | $\$ 1375.00$ |
| $87, \mathrm{X} 00$ |  |
| $86, \mathrm{X} 00$ | 2750.00 |

Not available on 56,800 or 87,800 Series Brakes.

## M3 Brass Pressure Plate

Typically used in marine applications or in applications where the potential for sparks need to be eliminated. Brass can also be used to reduce torque.

| Series | List Price <br> Adder |
| :---: | :---: |
| $56, \mathrm{X00}$ | See M4 |
| $65, \mathrm{X00}$ | $\$ 250.00$ |
| 81,$000 ; 82,000$ | 800.00 |
| $86, \mathrm{X00}$ | 1050.00 |
| $87, \mathrm{X00}$ | 600.00 |

## M4 Brass Stationary Discs

Used with brass pressure plate (List per disc).

| Series | List Price <br> Adder |
| :---: | :---: |
| $56, \mathrm{X00}$ | $\$ 250.00$ |
| $65, \mathrm{X00}$ | 250.00 |
| $87, \mathrm{X} 00$ | 450.00 |
| 81,$000 ; 82,000$ | 600.00 |
| $86, \mathrm{X} 00$ | 750.00 |

## W5 <br> Breather Drain

A drain plug is tapped into the bottom of the housing to let moisture escape. This option is only available on brakes with cast aluminum or cast iron housings.

| Series | List Price Adder |
| :---: | :---: |
| $56, \mathrm{X} 00$ | $\$ 380.00$ |
| $65, \mathrm{X} 00$ | 500.00 |
| 81,000 |  |
| 82,000 | 380.00 |
| $86, \mathrm{X} 00$ |  |
| $87, \mathrm{X} 00$ |  |

## M6 Class H Insulation

Brake is provided with an epoxy encapsulated coil, rated for NEMA Class H designation.
These Class H coils are standard on hazardous location brakes.

| Series | List Price Adder |
| :---: | :---: |
| $56, \mathrm{X} 00$ | $\$ 145.00$ |
| $87, \mathrm{X} 00$ | 175.00 |
| 81,000 | 285.00 |
| 82,000 |  |
| $86, \mathrm{X} 00$ | 570.00 |

| 86,000 | \$1,100 | \$1,375 | \$380 | \$780 | \$2,550 | \$2,950 |  | \$540 | \$940 |

${ }^{1}$ Standard Machining: The housing is machined for a thru shaft, and to allow for an encoder or tach to be mounted. This option is only available on brakes with cast aluminum or cast iron housings. Consult factory for availability.
${ }^{2}$ Close tolerance: The housing and endplate are assembled and dowel pinned together - then machined as a matched set for a through shaft and encoder mounting. This option is only available on brakes with cast aluminum or cast iron housings. This option is recommended for Series 81,$000 ; 82,000$; and 86, X00 due to the long distance between the motor and encoder.
${ }^{3}$ Tether Mount: The housing is machined for a through shaft, and a single tapped hole for a bolt to secure a tether arm. ( $56, X$ has a through hole and tach-welded nut on inside of housing, instead of a tapped hole).
${ }^{4}$ Referred to on the product pages in the catalog as IP23
${ }^{5}$ Referred to on the product pages as IP54/55 (these enclosure ratings no longer apply when the housing is machined for this modification - the customer is responsible for meeting any specific enclosure rating when assembling the encoder.
${ }^{6}$ M7 Modification for Series 81,000 and 82,000 will also require the M12 Modification; the side manual release.

## M8 Conduit Box with Terminal Strip

A terminal strip is located inside the conduit box. It allows for easy connection and identification of lead wires.

| Series | List Price Adder |
| :---: | :---: |
| All series except <br> hazardous location <br> (not available for the <br> 48,100 series) | $\$ 300.00$ (IP 23) <br> $\$ 600.00$ (IP 54) |
| All hazardous <br> location brakes | $\$ 600.00$ |

## M9 DC Coil Option

For DC voltage applications. Operates with an electronic DC switch module.

| Series | List Price Adder | Additional Adder <br> for Non-Standard <br> Voltage |
| :---: | :---: | :---: |
| $56, \mathrm{X} 00$ | $\$ 300.00$ | $\$ 250.00$ |

| 81,000 | 1050.00 | 250.00 |
| 82,000 | 1565.00 | 250.00 |
| $86, \mathrm{X} 00$ | 2625.00 | 500.00 |

For standard voltage listing, see the ordering information section for the specific brake.

Not available on Hazardous Location Brakes.

## M10 Nameplates

To order new brake nameplates, the serial number of the brake is required. A loose nameplate shipped from Stearns Division without being attached to a brake must have all agency markings removed (UL, CSA, etc.). In order to have a brake renameplated with the appropriate agency markings, it must be returned to Stearns Division for product verification.

| List Price: | First Nameplate | $\$ 150.00$ |
| :---: | :---: | :---: |
| Net Price: | Additional Mylar Nameplates | 1.50 |
|  | Additional Metal Nameplates | 4.00 |

## M11 Nonstandard Hub or Keyway

For standard bore diameter and keyway specifications, see specific brake selection page. For taper bores, consult factory for pricing.

|  | List Price Adder |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Description | $\mathbf{4 8 , 1 0 0}$ | $\mathbf{5 6 , X 0 0}$ | $65, \mathbf{X 0 0}$ | 81,000 <br> 82,000 <br> 86,000 | 87,000 |  |

| 87,000 IP 23 | $\$ 385.00$ includes casti <br> iron housing adder of <br> $\$ 110$ |
| 87,000 IP 54 | $\$ 275.00$ |
| 81,000 |  |
| 82,000 | $\$ 350.00$ |

## M13 Space Heater (115 or 230 Volt Only)

A space heater cartridge is used to prevent moisture build-up inside the brake housing.

| Series | Wattage | List Price <br> Adder |
| :---: | :---: | :---: |
| $56, \mathrm{X} 00^{*}$ | 15 | $\$ 210.00$ |
| 81,$000 ; 82,000 ; 86, \mathrm{X} 00$ | 50 and 75 | 275.00 |
| $87, \mathrm{X} 00^{* *}$ | 25 to 30 | 225.00 |
| Hazardous Duty Brakes | 25 to 50 | 750.00 |

*Not available on 56,800 or 87,800 Series Brakes
**Not available in 87,800 Class I

56,000 Series

87,000 Series (also representative of 81,$000 ; 82,000 \& 86,000$ Series)

The standard paint for all brake series (except BISSC Certified \& Maritime/Navy) is a red, water-base primer, painted inside and out.
For additional corrosion protection, a special (green) zinc chromate primer can be provided (painted inside and out) in place of the standard red primer. List price adders as shown.
Other Special Paint options are available - either primers, a white epoxy finish coat, or clean finish (exterior primer removed). Consult factory for pricing.

| Series | List Price Adder |
| :---: | :---: |
| $56, \mathrm{X00}$ | $\$ 210.00$ |
| $65, \mathrm{X00}$ | 300.00 |
| 81,$000 ; 82,000 ;$ <br> $86, \mathrm{X} 00$ | 550.00 |
| 87,000 | 525.00 |

BISSC Certified paint (white epoxy exterior paint) is standard for brake series with IP55 and IP57 enclosure ratings - and the prices are included in the standard list prices.
Maritime and Navy brakes have their own specified paints, with pricing included in the standard list prices.

## M15 Stainless Steel Self-Adjust Mechanism

For severe duty applications. This option includes a stainless steel pinion and plated wrap spring in the auto-adjust mechanism. It is only available on the 81,$000 ; 82,000 ;$ 86,000 and 87,000 Series Brakes

| Series | List <br> Price <br> Adder |
| :---: | :---: |
| 81,$000 ; 82,000 ;$ <br> 87,000 | $\$ 350.00$ |
| $86, \times 00$ | $\$ 700.00$ |

## M16 Stainless Steel Hardware

All external hardware is provided in stainless steel.

| Series | List Price <br> Adder |
| :---: | :---: |
| 48,100 | $\$ 125.00$ |
| $56, \mathrm{X} 00$, <br> $87, X 00$ | $\$ 150.00$ |
| $81,000,82,000$ <br> 86,000 | $\$ 275.00$ |

## M17 Terminal Strip

A terminal strip is located in the inside of the brake, on the support plate. It allows for easy connection and identification of lead wires.

| Series | List Price <br> Adder |
| :---: | :---: |
| ALL | $\$ 150.00$ |

56,000 Series

87,000 Series (also representative of 81,000; 82,000 \& 86,000 Series)

## M18 Thermostat (thermal switch)

This switch is used to indicate when a brake is overheating. Thermostats are standard in $8 \mathrm{X}, 300$ and $65, \mathrm{X} 00$ Series. This option is for NON-UL brakes only.

| Series | Switch Operation <br> Specificatons | List Price <br> Adder |
| :---: | :---: | :---: |
| $87, \mathrm{X} 00$ | Normally Closed: <br> Opens at $295^{\circ} \mathrm{F}$, Closes at $255^{\circ} \mathrm{F}$ | $\$ 400.00$ |
| $81,000,82,000$ <br> $86, \mathrm{X} 00$ | Normally Closed: <br> Opens at $210^{\circ} \mathrm{F}$, Closes at $180^{\circ} \mathrm{F}$ | 400.00 |
| $56, \mathrm{X} 00$ | Normally Closed: <br> Opens at $195^{\circ} \mathrm{F}$, Closes at $175^{\circ} \mathrm{F}$ | 400.00 |

This configuration allows for the motor shaft to extend beyond the housing of the brake.

This modification lowers the brake enclosure rating to IP10.

| Series | List Price Adder |
| :---: | :---: |

## M34 Derating of Torque

Stearns industrial SAB's can be custom built to meet your specific torque requirements.

| Series | List Price <br> Adder | Derate To |
| :---: | :---: | :---: |
| 56,500 | $\$ 315.00$ | $6 \mathrm{lb}-\mathrm{ft}$ |
| 87,100 | 315.00 | 20 or $30 \mathrm{lb}-\mathrm{ft}$ |
| $81,000 \& 82,000$ | 460.00 | To be <br> approved with <br> application <br> engineering |

## M35 Special Internal Lead Wire Hole with Bushing

Any non-standard, internal lead wire hole in the endplate.

| Series | List Price <br> Adder |
| :---: | :---: |
| All brakes except <br> hazardous location <br> brakes | $\$ 175.00$ |

SAB's can be provided with a split housing.

| Series | List Price <br> Adder |
| :---: | :---: |
| 81,$000 ; ~ 82,000$ <br> $\& 86,000$ | $\$ 725.00$ |
| 81,$000 ; 82,000$ <br> 86,000 gasketed | $\$ 1,000.00$ |
| 87,$000 ; 87,100$ <br> sheet metal | $\$ 200.00$ |
| 87,$000 ; 87,100$ <br> cast iron gasketed | $\$ 250.00$ |

## M37 Internal Release

An internal manual release requires that the housing be removed before the brake can be released by hand.
*N/A for hazardous location brakes

| Series | List Price <br> Adder |
| :---: | :---: |
| $87,0 X X ; ~ 81,0 X X ;$ <br> $82,0 X X ; ~ 86,0 X X$ | $\mathrm{~N} / \mathrm{C}$ |

## M38 Motor Gasket

The brake is provided with an additional C-Face gasket to be placed between the brake and motor.

| Series* | List Price <br> Adder |
| :---: | :---: |
| 81,$000 ; 82,000 ;$ <br> 86,000 | $\$ 100.00$ |
| $56, \mathrm{X00} \& 87,000$ | 75.00 |

*N/A for hazardous location brakes

## M39 Corrosion-Resistant Endplate

Rust preventative treatment applied to brake endplate.

| Series | List Price <br> Adder |
| :---: | :---: |
| $56,200,56,400$, <br> $56,500,56,800 \&$ <br> 65,300 | $\$ 425.00$ |
| 81,$000 ; 82, \mathrm{X} 00$ <br> $\& 86,000$ | 575.00 |
| $87, \mathrm{X} 00$ | 475.00 |

## M40 Special Milling: Flat Bottom on Housing \& Endplate

This modification is provided in the event the flange between the endplate and housing interfere with the mounting configuration.

| Series | List Price <br> Adder |
| :---: | :---: |
| 81,$000 ; 82,000$ <br> $\& 86,000$ | $\$ 650.00$ |

## W41 Brass Nameplate with Special Engraving

Brass nameplates offer greater durability in outdoor applications.

| Series | List Price <br> Adder |
| :---: | :---: |
| 81,$000 ; 82,000$ <br> $\& 86,000$ | $\$ 75.00$ |

## M42 Stainless Splined Hub

Stainless steel splined hubs are available for extreme outdoor applications, to prevent corrosion on the disc and hub interface.

| Series | List Price <br> Adder |
| :---: | :---: |
| 81,$000 ; 82,000$ <br> $\& 86,000$ | $\$ 1060.00$ |
| 87,000 | 800.00 |

## M43 Viton ${ }^{\circledR}$ Gasket

Gaskets and o-rings in brakes can be provided in Viton ${ }^{\circledR}$ (flourocarbon) material, in place of the standard neoprene. However, the V-wiper steel-backed seals that are used on pull rod manual releases are not available in Viton ${ }^{\circledR}$ and remain as neoprene.
Viton ${ }^{\circledR}$ is a registered trademark name of DuPont.

| Series | List Price Adder |
| :---: | :---: |
| 81,$000 ; 82,000 ; 86,000$ | $\$ 1,060.00$ |
| $87,000^{*}$ | $\$ 1,125.00$ |
| 56,000 | $\$ 950.00$ |

*Viton ${ }^{\oplus}$ gaskets and o-rings are standard for $87, \mathrm{X} 00$ series, except for hazardous location brakes where Viton ${ }^{\circledR}$ seals are N/A.
${ }^{* *}$ Except series 56,$200 ; 56,700$; \& 56,900 - where Viton gaskets are standard.

## M44 Special Friction Disc (per Disc)

Any non-standard friction disc in a brake. Cost is per disc.

Non-standard discs include: hi-inertia friction discs and heavy duty friction discs. Does not include carrier ring friction discs (see M46 and M47).

| Series | List Price <br> Adder |
| :---: | :---: |
| 87,000 | $\$ 50.00$ |
| 56,000 | 45.00 |

## M45 Splined Hub and Friction Disc

Standard on most models. Used for severe duty and reversing applications.

| Series | List Price <br> Adder |
| :---: | :---: |
| 87,300 | No Charge |

| Series | Torque <br> (lb-ft) | List Price <br> Adder |
| :---: | :---: | :---: |
| $87, \mathrm{X00}^{*}$ | $6-35 \mathrm{lb}-\mathrm{ft}$ | 190.00 |
|  | $50 \& 75 \mathrm{lb}-\mathrm{ft}$ | 290.00 |
|  | $105 \mathrm{lb}-\mathrm{ft}$ | 390.00 |

* Spline is standard on this series. Adder is for pre-revision 24-tooth spline.

## M46 Carrier Ring Friction Disc

The friction material is bonded to a steel or zinc/aluminum alloy ring.
This is used for severe duty applications and applications where people are being moved.

| Series | Carrier ring <br> material | List Price Adder <br> (per disc) |
| :---: | :---: | :---: |
| Horizontal Use Only |  |  |
| 81,000 | Steel | 700.00 |
| 82,000 | Steel | 700.00 |
| Horizontal or Vertical Use |  |  |
| $87, X 00 * * ~(n o t ~$ <br> available on 87,300 <br> or 87,800 series | Zinc <br> aluminum <br> alloy | 550.00 |
|  |  |  |

## M47 Carrier Ring Friction Disc (Bronze)

The friction material is bonded to a bronze ring. This is used for severe duty applications and applications where people are being moved.
Horizontal applications only
** Only available with pre-revision design, 24-tooth splined hub, which is included in this price

| Series | List Price Adder <br> (per disc) |
| :---: | :---: |
| 81,000 | $\mathrm{~N} / \mathrm{A}$ |
| 82,000 | $\$ 1050.00$ |
| 86,000 | 1250.00 |
| $87, \mathrm{X} 00^{* *}$ |  |
| $6-35 \mathrm{lb}-\mathrm{ft}$ | 925.00 |
| $50 \& 75 \mathrm{lb}-\mathrm{ft}$ | 1850.00 |
| $105 \mathrm{lb}-\mathrm{ft}$ | 2775.00 |

## M48 <br> 1,08X,000 Series Manual Adjust Mechanism

Excellent for holding applications when disc wear is not a concern. (Not available on hazardous location brakes.)

| Series | List Price Adder |
| :---: | :---: |
| 87,000 | Subtract \$50 List |
| 81,000 |  |
| 82,000 | No Charge |
| 86,000 |  |

## M60 Encoders

Internally mounted encoders are available in some series brakes, including some hazardous location brakes. See pages $52-53$ for series availability and additional information.

| Maximum Encoder Diameter <br> (in.) |  |
| :---: | :---: |
| $1-056$ | N/A |
| $1-087-\mathrm{E} 00$ | $2.0^{\prime \prime}$ |
| $1-081 \& 1-082$ | $2.5^{\prime \prime}$ |
| $1-086$ | $3.5^{\prime \prime}$ |

The Armature Actuated Brakes are spring-set, electrically released, friction devices, which develop holding and braking torque in the absence of electrical power. This type of brake can decelerate and hold a rotational load or can be ordered to provide a holding function only, where the motor is used as the dynamic brake.
AAB's are available to meet a wide range of braking requirements. Available sizes range from 3 lb -in up to 300 lb -ft static torque, in a variety of mounting options. A short hub is available for face mounting or to provide for maximum space efficiency. Features include Class H magnet wire coils, corrosion resistance, and optional manual release lever. Custom designs and modifications are possible; consult the factory for more information.

## Operating Principle

A hub which is attached to the shaft supports the rotatable friction disc. Brake torque is developed when springs apply a clamping force between the brake armature, friction disc and pressure plate. When
electrical power is applied, the armature is pulled by the electromagnetic force in the magnet body assembly which overcomes spring action allowing the friction disc to rotate freely. When electrical power
is interrupted, the electromagnetic force is removed and the pressure spring will mechanically force the armature plate to clamp the friction disc between itself and the pressure plate, thereby torque is developed.

Engaged Condition (power off)

- Compression spring

Disengaged Condition
(power on)

- Compression spring

Series 321 Totally - Pages 73-76 Enclosed Non-ventilated (TENV) \& Series 322 IP54 Enclosure

Sizes from 3 to 72 Ib-in (. 34 to 8.1 Nm ) of torque

## TENV

Direct mounting to 48 C and 56C motors
Sizes from 1.5 to 25 lb -ft (2 to 34 Nm ) of torque

Series 331 \& 333 Pages 79-80, 84
High performance brake for metric/IEC applications.
Direct drop-in for Kebco, Lenze, and Binder.

Sizes ranging from 3 to $300 \mathrm{lb}-\mathrm{ft}$, ( 4 to 400 Nm ) of torque

- Adaptors for NEMA frame sizes 48C through 405TC/UC - Enclosed version available in NEMA 48C through 215TC

Proving Switches Pages 89-93 and AC Rectifiers
Series 331 \& 333 NEMA C-Face

For use with AAB Series 333, 350, and 360

Pages 94-96
AAB Modifications Description, Availability, and Pricing

Select the proper torque rating based on horsepower and rpm (speed at the clutch or brake) using the Torque Selection Chart below. Based on 1.4 service factor.
For other service factors and speeds, use the formulas shown below.

Formula for TABLE 1

$$
\begin{aligned}
& T=\frac{63,025 \times P}{N} \times S F \\
& T=\text { Static torque, lb-in. } \\
& P=\text { Horsepower, hp } \\
& N=\text { Shaft speed at brake, rpm } \\
& S F=\text { Service Factor } \\
& 63,025=\text { Constant }
\end{aligned}
$$

Formula for TABLE 2

$$
T=\frac{5,252 \times P}{N} \times S F
$$

$\mathrm{T}=$ Static torque, lb-ft.
P = Horsepower, hp
$\mathrm{N}=$ Shaft speed at brake, rpm
SF = Service Factor
5,252 $=$ Constant

Caution: Do not use Table 1 to select brakes for overhauling or high inertial loads, or where a stop in specified time or distance is required. For these applications the total inertia of the load and power transmission system must be determined to make a brake selection. Refer to sections on torque and thermal ratings and determination.

## NOTE: Series 310 and 311 for holding applications only.

## TABLE 1

Series 320, 321, 322 Static Torque in Ib-in. (Nm)

| Motor hp | rpm |  |  |  |  |  |  |  |  |  |

[^10]

- Torque: 10 to 350 lb -in (1.1 to 39.5 Nm )
- UL Recognized Class H coil insulation system to US Standards (UR) and Canadian National Standards (CUR) - File E125303
- Spring activated and DC voltage released
- High torque, Compact size
- Corrosion resistant finishes
- Standard voltages 24 and 90 Vdc 115 and 230 Vac
- Available voltages 12, 36, 48 and 180 Vdc
- Low inertia rotating parts
- Splined hub for quiet dependable operation
- Holding applications only
- Installation and Service Instructions: P/N 8-078-888-00

Option A, Long Hub

- Provision for (4) B diameter mounting screws on K bolt circle

Table 3:
Options 311-64010-0H-J*

* Pass-through hub

NOTE: Non-standard bore sizes available, contact factory.
Add $\$ 60.00$ for non-standard bore size.
*Keyseats made to ANSI B17.1 standard.

- Torque rating 3 to 50 lb -in / (. 34 to 5.6 NM)
- UR and CUR Recognized insulation system, E-125303 and sizes 1.8, 2.8 brakes with internal power supply File E-71115
Class B temperature rise with Class H mag wire
- Available with two types of friction disc for holding (H) or dynamic (D) stopping applications
- Corrosion resistance
- Optional "double D" friction discs are available in 3-7 lb-in dynamic and 3-15 lb-in holding brakes. DD shafts fit the brake directly without a brake hub, no shaft keyway cost and simplify assembly
- Optional maintained manual release
- Optional mounting plates to make conversion over to the superior Stearns product easy
- Optional AC Rectifiers - internal or external in-line
- Optional band seal (not available for 1.2 size)
- Installation and Service Instructions: P/N 8-078-889-00

| $3 / 8$ | .063 | $.126 / .124$ | $.376 / .374$ |

NOTE: Contact factory for Double " D " disc on brakes greater than 7 lb -in nominal static torque

## AC RECTIFIERS

Internal rectifier is available only on the 1.8 and 2.8 models. external in-line rectifier is a standard option only on the 1.2 model.

NON-MAINTAINED MANUAL RELEASE

## BRAKE RELEASE INDICATOR

A mechanical switch which is activated by the manual release lever, and can be used to disconnect power in case of accidental start-up when the brake is manually released.

*Internal rectifier not available on size 2.8 brake with 72 mm bolt circle and 1.2 brake

NOTE: Other voltages available, contact factory. Add $\$ 40.00$ for nonstandard voltages
NOTE: $65^{\circ} \mathrm{C}$ maximum ambient temperature for all external in-line rectifiers

## High Cycling Brake

## Direct mounting to 48C and 56C motors

## Features

- TENV totally-enclosed non-ventilated

Series 321= IP42 Enclosure, Series 322 = IP54 Enclosure

- Out-of-box torque - No burnishing required
- Class B temperature rise with class H mag wire
- Brake housing integrated with mag body creating a heat exchanger that keeps the brake coil cool

- Field replaceable coil
- Splined hub and friction disc

## Options

- Internal rectifier
- Quick-set rectifiers - for fast response time even when wired directly across motor
- Maintained manual release
- Brake release indicator switch
- Single point torque adjustment- to $50 \%$ of nameplate torque
- Through-shaft
- Conduit box
- Quiet armature actuations
- Carrier ring friction disc

## Direct Replacement for European Brakes - *Kebco, Lenze, and Binder

## The 33X Series have the following design features:

- Direct Acting
- Torque rating 3 to 300 lb -ft (4 to 400 NM)
- UL Recognized Class H coil insulation system to US Standards (UR) and Canadian National Standards (CUR) File E125303
- Spring-set and DC voltage released AC rectifiers optional
- Series 333 torque adjustable
- Pre-adjusted air gap for easy assembly
- Corrosion resistance
- Spline hub for quiet dependable operation
- Metric and US Customary bore sizes

## Product Overview

## Options:

- AC rectifiers (full and half wave) See pages 86-89 for rectifier specifications
- Band seal (boot)
- Tach/encoder Mounting
- Manual release - NonMaintained or Maintained
- Shaft seal
- Mounting flange
- Electronic brake release indicator switch

## 333 Series

Static torque from 3 to $300 \mathrm{lb}-\mathrm{ft}$, with nine different sizes ranging from 72 mm bolt circle up to 278 mm bolt circle.
Torque can be adjusted down to approximately $50 \%$ of the nameplate torque rating.
Shown here with optional nonmaintained manual release lever; other options include boot (band seal), end cap plug, through-shaft seal, and many more listed in the AAB Modification Section.

## 331 Series

Basic brake without the torque adjust option.
Available in torque ratings from 3 to $300 \mathrm{lb}-\mathrm{ft}$ ( 4 to 400 Nm ).
Manual release optional, can be provided with non-maintained release lever or maintained release bolts.
Metric mount; also can be ordered with Cface adaptor or as the C-face Enclosed version,
 and as Severe Duty.

## 33X Series with C-face Adaptor

Series 331or Series 333 can be provided with a C-face adaptor for motor frames from 48C through 404/405TC, TSC, UC, USC.
All other available modifications for the $33 X$ Series can be ordered for this brake.

## 33X Series Enclosed

Series 33 X with a C-face adaptor and a brake housing. Order as an IP43 Enclosure with or without external manual release:
33B Series for brake without torque adjust 33C Series for brake with torque adjust
OR IP54 Enclosure with the option of internal maintained manual release:
33H Series for brake without torque adjust 33J Series for brake with torque adjust

## Also Available.....

## 330 Series

Magnet body is not machined for a manual release option. See ordering information for the 33X Series brakes.

## 33X Severe Duty

Any of the 33X Series can be ordered as Severe Duty, appropriate for high-cycle rate applications. See ordering information for the 33 X series brakes.

## 332 Series

Basic brake with the torque adjust option, and the magnet body not machined for the manual release option. See ordering information for the $33 X$ series brakes.

*In-line rectifier. Add $\$ 92.00$ to brake list price
**In-line quickset rectifier. Add $\$ 140.00$ to brake list price.
Contact factory for non-standard coils.
Add the following for non-std. coil voltage

- Sizes 72 through $112=\$ 188.00$
- Sizes 132 through $170=\$ 216.00$
- Sizes 196 through $278=\$ 308.00$

For separate AC rectifiers see pages 89-92

Table 3-Options 333-14010-14-E *

| Character <br> to <br> insert | Description/Options |
| :---: | :--- |
| A | Basic brake |
| C | Option A with non-maintained <br> release |
| G | Short hub with non-maintained <br> release |
| J | Steel hub for press-fit applications |
| K | Steel hub, non-maintained release |
| L | Internal manual release, <br> non-maintained |
| R | Maintained manual release (bolts) |

Modifications are availablesee AAB Modification Section

## Features

- Torque rating 102-400 Nm, 75-300 lb-ft
- Universal mounting
- Class H insulation
- Maintained manual release
- Corrosion resistance (stainless steel external hardware)
- IP56 enclosure protection (available in ductile cast iron or aluminum cover)
- ABS, CSA and CE certification
- Simple wear adjustment with access hole for air gap inspection
- Metric and US Customary bore sizes
- C-Face mounting - various adapter plates available for 182TC through 405TSC frame mounting
- Splined hub for quiet dependable operation
- Installation Instructions/Parts List: P/N 8-078-895-00

## Standard Options

- AC rectifier (see pages 86-89)
- Tach/encoder mounting
- Space Heater 115, 230 or 460 Vac
- Thru-shaft
- IEC D and C Flange
- Conduit Box- specify F1 or F2 location (F1 location shown)

F1 Conduit Box location shown.
F2 location on left side facing brake housing.

Shown with optional conduit box

Reverse view showing adapter mounting plate orientation

Brake showing space heater and release indicator location

Features

- Universal mounting
- Internal maintained manual release
- IP56 enclosure
- ABS, CE, and CSA Certification
- Brake gaskets are captive (O-Ring), so parts are not lost during maintenance
- Stainless Steel nameplate (exterior)
- Modular brake assembly Install and remove brake without having to readjust air gaps
- Class H insulation
- Installation Instructions and Parts List:
P/N 8-078-898-00

## Standard Brake Options

- AC Rectifier
(see pages 86-89)
- Tach/encoder mounting
- Space Heater
- Electronic brake release indicator
- Contact Factory for Electronic Wear Indicator
- Thru-Shaft
- Optional external non-maintained/maintained manual release
- Optional IP56 or IP67 conduit box mounted on adapter plate. Wiring is not disturbed when brake housing is removed

F1 Conduit Box location shown. F2 location on left side facing brake housing.

NOTE: Final part number may change due to specifications or options selected or other product design considerations. A number such as a 2, 3, 4 etc., in the $12^{\text {th }}$ position is used to designate a unique brake (custom) and can only be assigned by Stearns Design Engineering Department.
Modifications are available - see AAB Modification Section.

## Product Overview

NOTE: For brake response times with and without AC rectifiers see page 97.
 Maximum operating voltage is $+10 \%$ of nominal, frequency $50 / 60 \mathrm{~Hz}$, maximum ambient temperature range of $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}$

## Combination Full and Half Wave

Provides option of utilizing either full or half wave rectification Maximum operating voltage is $+10 \%$ of nominal, frequency $50 / 60 \mathrm{~Hz}$. Maximum ambient temperature range is $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}$

## TOR-AC Full and Half Wave

Provides coil turn off nearly as fast as DC side switching. Includes line filter for AC drive applications or whenever electrical filtering is required to protect the rectifier from high-frequency electrical line pulses. Must be switched on/off by a switch in an AC lead of the TOR-AC. Maximum operating voltage $+10 \%$ of nominal, frequency $50 / 60 \mathrm{~Hz}$.
Maximum ambient temperature range is $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}$

## QuickSet

> A rectifier that provides a quick brake response time even when the rectifier is permanently wired across the windings of an AC motor. The QuickSet Rectifier detects the decaying, motor generated voltage that occurs when power is removed from the motor circuit, and interrupts brake coil current in response. QuickSet Rectifiers can be specified full wave or half wave.
> Operating voltage is $\pm 10 \%$ of nominal, frequency $50 / 60 \mathrm{~Hz}$.
> Maximum ambient temperature range is $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}$

QuickSet/QuickRelease A rectifier that provides a timed, full wave rectified "over-excitation" brake release function, followed by continuous, half wave rectified brake released "holding" function, when used in conjunction with an appropriate brake coil voltage rating.
USED AS WATTSAVER: Provides a timed, full wave rectified brake release function, followed by continuous, half wave rectified brake released "wattsaver" function, when used in conjunction with an appropriate brake coil voltage rating. The Wattsaver serves to reduce the electrical power consumption and dissipation of the brake in the released state.
Operating voltage is $\pm 10 \%$ of nominal, frequency $50 / 60 \mathrm{~Hz}$. Maximum ambient temperature varies by part number - see information by part number on following pages.

## Bi-Phase Rectifiers

A rectifier that is typically used in single phase, reversing, permanent split capacitor (PSC) motor applications. A single phase, reversing, PSC motor typically has two windings of equivalent resistance. The winding which serves as the main winding is connected directly across the power line, the winding which serves as the auxiliary winding is connected in series with a run capacitor across the power line. The direction of rotation is reversed by interchanging the function of the two windings. The Bi-Phase Rectifier provides the same voltage to the brake coil regardless of the direction of rotation of the motor. The Bi-Phase Rectifier has five leads and comes in standard response and QuickSet versions. Bi-Phase Rectifiers are application specific. Please contact factory for more information.

Wiring Diagrams/Switching NOTE: For brake response times with and without AC rectifiers see page 101

Indicates when the brake is released by sensing the change in the brake coil current waveform. For use with the Series 333/350/360 brakes

## Brake Operation

When electrical power is applied to the armature-actuated brake coil, the armature is attracted by the electromagnetic force generated by the magnet body, which overcomes spring action. This allows the friction disc to rotate freely. When electrical power is interrupted, the electromagnetic force is removed and the pressure spring mechanically forces the armature plate to clamp the friction disc between itself and the pressure plate. This develops torque to stop or hold the load.

## Switch Operation

When the brake armature is pulled in to the magnet body to release the brake, a change in the brake coil current waveform occurs. By tracking this change in the brake coil current, the electronic switch indicates when the brake is released.

| Ordering Information |  |
| :---: | :---: |
| List Price | Discount Symbol |
| $\$ 330.00$ | R3 |

Part Number Example: 4-4-07090-XX

| DC <br> Voltage* $^{*}$ | Characters <br> To Insert |
| :---: | :---: |
| 24 | 024 |
| 90 | 090 |
| 103 | 103 |
| 180 | 180 |
| 205 | 205 |
| 258 | 258 |
| 414 | 414 |

*Standard voltages listed. For other voltages, contact factory.

Specify brake model number. The last 2 digits of the switch part number will depend upon the brake size

NOTE: Cannot be used with half-wave rectifier. Use with full-wave or TOR-AC full-wave rectifier only.

## SAB Motor Frame Adapter Dimensions

## Selection

To select an adapter for a specific brake, refer to the Motor Frame Adapter Tables as shown in the brake series sections of this Catalog. After selecting the adapter stock number, refer to the Tables below for dimensions.
All adapters are constructed with an opening for internal lead wire connection, corresponding to the NEMA standard location for the motor frame size.
Screws for mounting adapter to motor must be provided by customer. Socket head cap screws are supplied for mounting brake to adapter.

* 1/2-13 flat head screws are supplied with adapter.
** When adding an adapter to a hazardous location brake, refer to the "mounting requirements" on the product page for the recommended brake series for accommodating adapters.

Brake Side

Kits include the foot mounting bracket and hardware to fit the BF mounting holes.

Dimensions for estimating only. For installation purposes, request certified prints.

## Brakes Externally Wired to Motor

C-face motor with double shaft extension.

Stearns Disc Brakes are designed to mount on standard C-face motors having the same dimensions and tolerances on the accessory end as on the drive end. They also mount on foot mounting brackets and machine mounting faces having the same mounting dimensions and tolerances. Some motor accessory end C-face may differ from the drive end.

Dimensions for
rames where AJ is
greater than AK

# SINPAC Switches: Brief Operating Description 

For over 75 years, single-phase motors have utilized a mechanical centrifugal switch to switch the start circuit. Inherent characteristics of a mechanical device have made these switches prone to various problems, including tolerances, tolerance buildups, mechanical fatigue, vibration and a host of others that can lead to switch failures and/or performance inconsistency.
Our challenge was to design a reliable solid-state switch to replace the mechanical switch and actuator mechanism, and duplicate the function of connecting and disconnecting the start circuit at particular speeds with the additional benefits of a solid-state device. After considerable research, we decided a successful electronic motor starting switch could be created by sensing the voltages present in the main and start windings.

Until the rotor of a single-phase motor begins to rotate, there is no coupling between its start winding and main winding. When the rotor begins to turn the main winding induces flux in the rotor, which then induces a voltage in the start winding. The voltage induced in the start winding is directly proportional to motor speed.

In Stearns SINPAC Electronic Switches, the voltage across a motor's main winding and the voltage across its start winding are sampled and fed to a comparator. The logic circuitry is designed so that the electronic switch interrupts the start circuit current after the motor has accelerated to the speed at which cut out voltage is developed, generally 75 to $80 \%$ of synchronous motor speed. The logic circuitry then shuts down the switch's power stage, which consists of a triac or inverse parallel SCR's. This function is referred to as "cut out." When the start circuit is disconnected, the main winding field then drives the motor's rotor to its running speed.

If the motor encounters an overload, and the motor speed falls to approximately 50\% of its synchronous speed, the SINPAC Switch automatically reconnects the motor's start circuit. This function is referred to as "cut in." Cut in detection circuitry constantly monitors start winding voltage. When the motor's speed falls to the cut in point, the detection circuit causes the control logic to energize the SINPAC Switch's power output stage. The motor then goes through its normal startup procedure, with the start circuit being switched out at a motor
speed approximately 75 to $80 \%$ of synchronous speed.

SINPAC Switches are potted and completely sealed, making it impervious to dust, dirt and moisture. The unique speed sensing circuit provides a universal design which allows a few switches to work on most standard motor designs regardless of manufacturer.

## Acceptance by Motor Manufacturers

US and foreign motor manufacturers have tested and retested the SINPAC Switch for reliability and quality. Today, many of these manufacturers have begun installing SINPAC Switches on their standard motor lines with more companies ready to make the changeover.

## UL Recognition

Most SINPAC Switches have already been recognized under the Component Program of Underwriters Laboratories, Inc. (E-71115). In addition, all switches have internal surge protection which is tested according to ANSI/IEEE
C62.41-1991 Category A3. CSA
Certification LR-6254.

## Mounting Options

(1) Electrically Protected. Designed to filter out electrical noise, so there is no concern of random switch malfunction.
(2) Reduced Installation Time. Easy accessible $1 / 4$ inch terminals and mounting, reduce the amount of time required to install SINPAC Switches or to change out mechanical switches.
(3) Restart Capability. When motor speed drops below $50 \%$ of synchronous speed, the start winding is brought back into the circuit to reinitiate starting torque.
(4) Soldered Heat Sink. High cycling.
(5) Transient Protection. Transient protection tested per ANSI/IEEE C62.41-1991 Category A3.
(6) Universal Design. $50 / 60 \mathrm{~Hz}$ operation. Will work on 2,4 or 6 pole motors of any manufacturer. Reduced inventory.
(7) Line Voltage Compensation. No modifications or changes are required for line voltage variations. SINPAC Switches will operate in areas susceptible to brown-outs or low voltage due to long wiring runs.

## ADDITIONAL FEATURES

- Operating Temperature: $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}\left(-40^{\circ} \mathrm{F}\right.$ to $149^{\circ} \mathrm{F}$ ) (for operation between $65^{\circ} \mathrm{C}$ and $85^{\circ} \mathrm{C}$ ( $149^{\circ} \mathrm{F}$ and $185^{\circ} \mathrm{F}$ ), consult factory.]
- Operating Voltage: 115 Vac SINPAC Switch: 90-130 Vac. For dual voltage motor equipped with center-tapped main winding: $90-130$ Vac or 180-265 Vac. 230 Vac SINPAC Switch: 190-255 Vac.

## Typical Applications

Stearns SINPAC Switches are ideal for applications requiring reliable switching of the start circuit in singlephase motors.
Mechanical switches are prone to various problems including mechanical fatigue, tolerances, tolerance build-ups and vibration which can lead to performance inconsistency.
Electronic SINPAC Switches solve all those problems which reduce production downtime in hundreds of applications. Some of these applications are illustrated below:

## Some additional applications include:

- Grain Dryers
- Water Equipment
- Power Tools
- Commercial Dryers
- Commercial Washing Machines
- Ice Makers
- Gas Pumps
- Floor Washers
- Bottle Washing Machines
- Floor Sanders
- Poultry Feeding Systems
- Fans, Blowers
- Grinding Machines
- Milking Machines
- Winches

- 50/60 Hz
- Paint Sprayers
- Pressure Sprayers
- Vibrators
- Auger Drives
- Door Openers
- Sump Pumps
- Diaphragm Pumps
- Hermetic Motors
- Rotary Compressors
- Refrigeration Compressors
- Heat Pumps
- Jet Pumps
- Food Processing

Motor hp ratings are typical. For an accurate selection procedure, measure start winding current during a normal start or at locked rotor and select a SINPAC Switch with higher maximum current rating than that measured.

1. Be sure switch series matches motor type.
2. Be sure switch voltage rating matches (start) circuit voltage rating.
3. Selection can be based on actual measurement of start winding current ortwo times the motor nameplate FLA rating.
4. Switch current rating must match or exceed the motor start winding current requirements. Always select a SINPAC Switch with the next higher current rating for:
a) High cycling applications.
b) Long acceleration time.
c) High ambients: Greater than $55^{\circ} \mathrm{C}$.
5. To assure proper motor operation, the voltage across the start winding must reach the SINPAC Switch cut out reference voltage between $70 \%$ to $85 \%$ of motors synchronous speed.
Caution: SINPAC Switches are line voltage compensated. Changes in the line voltage will not effect system operation unless an overload condition causes reduced running speed, along with reduced voltage across the start winding.
6 . Higher current switches can be used in place of lower rated switches of the same series.

## SINPAC Electronic Switch Catalog Numbering System

| Start Winding Voltage |
| :--- |
| blank $=115,2=230$ |

| Series |
| :--- |
| CVR = Capacitor Start and Capacitor Start/Capacitor Run Motors, $P V=$ Split Phase Only, |
| $C V$ - Capacitor Start Only, $V R=$ Capacitor Start/Capacitor Run Only, $I R=$ Capacitor Start Instant Reverse |

## PV Series

Induced voltage across the start winding is directly proportional to motor speed and line voltage. All SINPAC Switches use this voltage to switch the start winding out of the circuit. Your motor with a SINPAC Switch must generate a voltage that is $20 \%$ greater than the switch cut in voltage to assure cut out of the start winding. Refer to the chart below.

## CV , VR, CVR, and IR Series

Induced voltage across the start winding is directly proportional to motor speed and line voltage. All SINPAC Switches use this voltage to switch the start capacitor out of the circuit. Your motor with a SINPAC Switch must generate a voltage that is $20 \%$ greater than the switch cut out voltage to assure cut out of the start capacitor. Refer to charts below.

# PV and 2PV Series for 115 Vac, 230 Vac or 115/230 Vac Dual Voltage Split Phase Motors 

 Dual Voltage Split Phase Motors}

## Basic Operation

The PV Series SINPAC uses a pulse sampling technique to monitor RPM-sensitive information (induced voltage) across the motor start winding. After the initial timing period, solid-state logic will sample the induced voltage across the start winding and will repeat this sequence until the voltage across the start winding is above the cut-in reference value. The SINPAC logic circuit continues to monitor the RPMsensitive information (induced voltage) on the start winding. If the SINPAC logic detects that the motor RPM drops below a certain point, it automatically recloses the solid-state switch reconnecting the start winding. Both the initial timing period and cut-in reference value can be modified to meet specific applications.

M - Motor main winding, ST - Motor start winding

# CV Series for 115 Vac or 115/230 Vac Dual Voltage Capacitor Start Motors 

## Basic Operation

Capacitor start motors require a method to extract speed data from the voltage across the motor start winding. By comparing the start winding RPM-sensitive voltage with the main AC input voltage (which serves as a reference voltage), the switch determines when the start circuit should be energized. The electronic switch interrupts the start circuit current after the motor has accelerated to the cut out speed, and reconnects the start circuit whenever the motor speed has fallen to cut in speed (usually about $50 \%$ of synchronous motor speed).

# VR Series for 115 Vac or 115/230 Vac Dual Voltage Capacitor Start/Capacitor Run Motors 

## Basic Operation

Capacitor start/capacitor run motors provide continuous voltage sensing information which can be used to extract speed data from the voltage across the motor start winding. By comparing this start winding RPM-sensitive voltage to the main AC input voltage (which serves as a reference voltage), the switch determines when the start circuit should be de-energized. The electronic switch interrupts the start circuit current after the motor has accelerated to the cut out voltage (speed), and reconnects the start circuit whenever the speed sensitive circuit senses the motor voltage (speed) has decreased to a preselected cut in voltage (RPM) level.
Capacitor start/capacitor run motors exhibit current transients and higher voltages across the start switch. These electrical stresses occur due to the switching of the two capacitors (start and run) that are connected
 in parallel during motor start and may have different voltages at time of restart. These stresses occur at restart with both mechanical and electronic start switches. The VR switch features circuitry designed to eliminate the effects of these conditions.

## Wiring Diagram

[^18]
## 2CV Series for 230 Vac Capacitor Start Motors 2VR and 2CVR Series for Capacitor Start/Capacitor Run Motors

## Basic Operation

Capacitor start/capacitor run motors and capacitor start motors provide continuous voltage sensing information which can be used to extract speed data from the voltage across the motor start (auxiliary) winding. By comparing this start (auxiliary) winding RPM-sensitive voltage to the main AC input voltage (which serves as a reference voltage), the switch determines when the start circuit should be de-energized. The electronic switch interrupts the start circuit current after the motor has accelerated to the cut out speed, and reconnects the start circuit whenever the motor speed has decreased to a preselected cut in RPM level. Capacitor start/capacitor run motors exhibit current transients and higher voltages across the start switch. This electrical stress is due to the voltage differential which may exist between the start and run capacitors at the instant of switch closure. This stress phenomenon occurs with both mechanical and electronic type start switches. SINPAC Switches have voltage detection circuitry to minimize the effects of these conditions.

## Basic Operation

Bidirectional motors - those that can rotate in either direction - are of two classes: 1. Reversing motors, which can change from full speed in one direction to full speed in the opposite direction. 2. Reversible motors, which can be reversed only when the motor is not running, or is running below cut out speed. Some motor manufacturers distinguish between quick reversing and instant reversing. A quick reversing motor requires a time delay of approximately $1 / 25$ th of a second or more for the switching circuitry to react. An instant reversing motor requires absolutely no time delay. The standard SINPAC Switch can be used on reversible and reversing motors. The SINPAC IR Series Switch provides the function of a direction sensing centrifugal switch and makes a reversible capacitor start motor into an instant reversing motor.
In order to reverse a single-phase motor, it is necessary to reverse the polarity of either the start or main winding, but not both at the same time. The reversal of the winding is accomplished with an
external reversing switch or contactor that is not part of the SINPAC Switch. SINPAC Instant Reverse Switch is not dependent upon how quickly the user operates the reversing switch, but only that the reversing switch did change states, i.e., forward to reverse, or vice versa. The SINPAC Switch detects the change in the phase shift between the main and start windings, and the logic circuit instantly actuates the starting switch, causing the start circuit to be reconnected to line
 voltage. This connection causes the motor to decelerate and then reaccelerate in the opposite direction. The SINPAC IR Series Switch interrupts the start circuit current after the motor has accelerated to the cut out speed, and reconnects the start circuit whenever the circuit senses the motor speed has fallen to cut in speed (usually about $50 \%$ of synchronous motor speed).

# TENV/IP54 Super-Mod ${ }^{\circledR}$ Clutch-Brake Modules 

Imagine a totally-enclosed, nonventilated clutch-brake ready to work right out of the box, requiring no modifications. And at a price competitive with "open" enclosure clutch-brakes.
TENV Super-Mod will give you extended cycles, enhanced operating efficiency and longer operating life. TENV Super-Mod Modules are well suited for challenging applications where water, moisture, dirt, dust and other airborne pollutants can shorten the life of traditional clutch-brakes.
Examine these key value-added features:

- Cast-aluminum housing that meets IP54 requirements, preventing moisture and dirt from affecting operation of the unit
- Integrally cast, clutch-side magnetic body and endbell provides large heat sink that conducts heat away from coil
- Brake-side magnetic body integrated with cast housing creates a heat exchanger that keeps the brake coil cool
- Unique fan design creates bidirectional air movement within the unit. This stabilizes internal temperatures and eliminates hot spots. The fan is cast into the drive hub and is equally efficient at moving air axially through the housing during motor rotation in either direction
- Depending on the model, between 28 and 60 percent fewer parts than competitive units for enhanced reliability and service life
- Armature assembly features an automatic gap adjustment that maintains a consistent de-energized armature-to-friction-face air gap
- Completely gasketed conduit box resists moisture and spray
- Washdown (IP55) availability in select models

For even better performance, include an optional Tor-ac ${ }^{\text {TM }}$ rectifier for 115 or 230 Vac input. Tor-ac rectifiers connect directly to the AC power source for switching on the AC-side. This eliminates contact arcing, improving the life of associated switching components while providing you with mechanical response times comparable to DC-side switching.
The Stearns TENV Super-Mod Module comes in a wide range of popular sizes with nominal static torque ratings from 16 and $145 \mathrm{lb}-\mathrm{ft}$. Each unit is designed as an exact drop-in replacement, so you can upgrade today or at your next regularly scheduled maintenance shutdown.

# Super-Mod ${ }^{\circledR}$ Clutch-Brake Modules 

## How To Select The Proper <br> Unit For Your Application

BACK TO TABLE OF CONTENTS
$1^{\text {st }}$
Select the appropriate configuration based on the relationship with the motor, gearbox and drive components.

C-face mounted brake, clutch or clutch-brake, module (20, 1020 or 1040)

C-face mounted brake, clutch, or clutch-brake module. Mounted between moto and gearbox $(20,1020$, or 1040)

Determine if the application requires clutching only, braking only or a clutchbrake combination

## Clutch Only

Provides a start and/or continuous motion until the control logic disengages (removes the power or voltage from the unit's coil).

NOTE: The load will coast since no braking action is provided.

## Brake Only

Provides a stop and hold, typically of a motor shaft, until the control logic disengages (removes the power or voltage from the unit's coil).

## Clutch-Brake

Provides a start-stop motion used for cycling, intermediate or random motion and controls a load or machine element. Both the clutch and brake coils are electrically engaged (power on), however, the control logic should not signal both coils to be engaged at the same time.
$3^{\text {rd }}$ Select the proper size/torque rating based on horsepower and RPM (speed at the clutch or brake) using the Super-Mod Selection Chart to the right. Based on 2.75 service factor.

For other service factors and speeds, use the formulas shown to the far right.
CAUTION: RPM refers to shaft speed at clutch or brake.

Note: Frame size and shaft diameter may affect selection and should be considered. See manufacturer's dimensional and sizing information.

## Super-Mod Selection Chart

Where:
$\mathrm{T}_{\mathrm{d}}=$ Average dynamic torque, lb-ft
P = Horsepower, HP
$\mathrm{N}=$ Shaft speed
differential at clutch
and/or brake components, RPM

SF = Service factor
5252 = Constant

$4^{\text {th }}$

Ensure that the unit can properly dissipate the heat generated by the application. Thermal capacity can be calculated as follows:

$$
E=1.7 \times W R^{2} \times\left(\frac{N}{100}\right)^{2} \times F
$$

E = Energy (heat) which needs to be dissipated in foot pounds per minute
(ft-lb/min) for the application requirement.
$\mathrm{WR}^{2}=$ Total reflected inertia at clutch-brake shaft location. This should include clutch-brake inertia.

| Inertia (lb-ft²) | SM 50, 100, 180 | SM 210, 250 |
| :---: | :---: | :---: |
| Clutch/Brake | 0.063 | 0.144 |
| Clutch Only | 0.04 | 0.08 |
| Brake Only | 0.035 | 0.08 |

$\mathrm{N}=$ Speed differential in revolutions per minute at the clutch-brake shaft.
F = Number of cycles per minute (cycle rate)

The thermal capacity requirements calculated should be compared to the thermal capacity ratings. Exceeding this rating could cause overheating and possible failure. SM 50-100-180 can accommodate 5,000 ft-lb/min; SM-210 7,000 ft-lb/min; and SM-250 5,600 ft-lb/min.

## 5

th Options
Select any other options you may require.

## Tor-ac Kit

Single-channel, solid-state, quick-response rectifier circuit can be mounted in any SM unit which allows you to switch on the AC-side with mechanical response times comparable to traditional DC-side switching.

## Adapter Kit

An input adapter kit can be stocked which gives you immediate flexibility to modify to double shafted configurations. See page 115 for ordering and dimensional information.

## Base Kit

A base kit can be added to clutch only (1040) or clutch-brake (1020) units. See page 16 for ordering and dimensional information.

## 6 <br> Special Applications

## Low Speed

Application of clutches and brakes at speeds of 300 RPM or less may not permit sufficient burnishing or run-in to occur, the result being reduced and erratic torque output. For these applications, we suggest using a unit which has a static torque rating of at least two times the calculated torque requirement.

## High Cycle Rates

Applications where high cycle rates are required could result in heat being generated
which is in excess of the unit's capability to dissipate. The thermal capacity requirement equation should be used to size the clutch and/or brake for this type of application. High cycle rates may also require special highspeed controls.

## Washdown

For applications requiring regular washdown, such as food processing or other wet, highhumidity environments use the Super-Mod TENV Washdown Clutch-Brake Modules.

- Models in most popular sizes with nominal static torque ratings of 16 and $35 \mathrm{lb}-\mathrm{ft}$.
- Fully neoprene gasketed with BISSC approved white epoxy paint.

## Soft Starts And/Or Stops

While the Stearns Gap feature is desirable in most applications, there are some situations where it should be disabled, such as very soft starts and/or stops achieved with low voltage energizing of the coil. For applications where the voltage will be varied to below $75 \%$ of the coil rating, request that the Stearns Gap feature be disabled.

# Super-Mod ${ }^{\circledR}$ Clutch-Brake Modules: SM-1020, SM-1020WD (Washdown) and SM-2030B 

- 56C through 215TC NEMA Frame Sizes
- 16 through $145 \mathrm{lb}-\mathrm{ft}$ Static Torque; 2400 Maximum RPM
- TENV - Totally Enclosed (Non-Ventilated) IP-54 Enclosure Protection, (IP-55 for Washdown Units)
- Listed by Underwriters Laboratories, Inc., File E-71115 and CSA Certified, File LR-6254
*See Series 56,700 and 87,700 for power-off "fail safe" C-face coupler units
- Power-On Clutch and Brake* Engagement
- Maximum Overhung load capacity is 85 lbs

## Mechanical Flexibility through Conversion Kits

Super-Mod units are stocked in a wide range of configurations and voltages. Additionally, to keep your inventory down and provide quick shipments, Super-Mod provides the answer with inexpensive, easy to use, stock conversion kits. Stock either the base kit, adapter kit, Tor-ac kit or all of them and you can quickly modify your standard clutch (1040), or clutch-brake (1020) into almost any configuration (2030TB, 3040B for example).
Super-Mod is an innovative product. When combined with your equipment, it provides added value through increased reliability and reduced inventory.
Input Adapter Kit (For use with Super-Mod only)

## Introduction

Information and guidelines provided in the application section are intended for general selection and application of spring set brakes. Unusual operating environments, loading or other undefined factors may affect the proper application of the product. Stearns application services are available to assist in proper selection or to review applications where the specifier may have questions.
A spring set brake is used to stop and hold a rotating shaft. Generally the brake is mounted to an electric motor, but can also be mounted to gear reducers, hoists, machinery or utilize a foot mount kit.
The brake should be located on the high speed shaft of a power transmission system. This permits a brake with the lowest possible torque to be selected for the system.
Spring set disc brakes use friction to stop (dynamic torque) and hold (static torque) a load. Energy of the motor rotor and moving load is converted to thermal energy (heat) in the brake during deceleration. The brakes are power released, spring applied. No electrical current is required to maintain the spring set condition.
The system designer will need to consider the mount surface and match the brake to the load and application. Factors include: brake torque, stopping time, deceleration rate, load weight and speed, location and environment. Brake thermal ratings, electrical requirements and environmental factors are discussed in separate sections.

## Electrical Considerations

Solenoid actuated brakes (SAB's) are available with standard motor voltages, frequencies and Class B or H coil insulation. Most models can be furnished with either single or dual voltage coils. Coils in most models are field replaceable.
Inrush and holding amperage information is published for the common coil voltages and factory available for other voltages or frequencies. Amperage information for specific coil sizes is provided for selection of wire size and circuit protection at brake installation. Fixed voltage $-50 / 60 \mathrm{~Hz}$ dual frequency coils are available in many models.
All SAB AC coils are single phase and can be wired to either single or three phase motors without modifications. All solenoid coils have a voltage range of $+/-10 \%$ of the rated nameplate voltage at the rated frequency. Instantaneous rated voltage must be supplied to the coil to insure proper solenoid pull in and maximum coil cycle rate. The plunger rapidly seats in the solenoid and the
amperage requirements drops to a holding amperage value.
Instantaneous voltage must be supplied to the coil to insure proper solenoid pull-in and maximum coil cycle rate.
Because Stearns Solenoid Actuated Brakes (SAB's) require low current to maintain the brake in the released position, the response time to set the brake can be affected by EMF voltages generated by the motor windings. It may be necessary to isolate the brake coil from the motor winding.
The solenoid coil cycle rate limits the engagements per minute of a static or holding duty brake. Brake thermal performance, discussed in another section, limits engagements per minute in dynamic applications.
Class $B$ insulation is standard in most SAB models, class H coil insulation is optional and is recommended for environments above $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$, or rapid cycling applications.
Armature actuated brakes (AAB's) are available in standard DC voltages. Available AC rectification is listed in the catalog section. Wattage information is provided in the catalog pages. Unlike solenoid actuated brakes, armature actuated brakes do not have inrush amperage. Coil and armature reaction time and resulting torque response time information is available. Like SAB, mechanical reaction time depends on typical application factors including load, speed and position.
Electrical response time and profiles are unique to the SAB and AAB. Reaction time requirements should be considered when selecting or interchanging brakes.
All Stearns brake coils are rated for continuous duty and can be energized continually without overheating. The coil heating effect is greatest at coil engagement due to engaging, pull in or inrush amperage.
Temperature limits as established by UL controls standards are:
Class A insulation $\quad 221^{\circ} \mathrm{F}\left(105^{\circ} \mathrm{C}\right)$
Class B insulation $266^{\circ} \mathrm{F}\left(130^{\circ} \mathrm{C}\right)$ Class H insulation $356^{\circ} \mathrm{F}\left(180^{\circ} \mathrm{C}\right)$.

## Types of Applications

In order to simplify the selection of a disc brake, loads can be classified into two categories, non-overhauling and overhauling.
Loads are classified as non overhauling, if (1) no components of the connected equipment or external material undergo a change of height, such as would occur in hoisting, elevating or lowering a load, and (2) there is only rotary motion in a horizontal plane. For example, a loaded conveyor operating in a horizontal plane
would be typical of a non-overhauling load.
If the same conveyor were transporting material to a lower level, it would be classified as an overhauling load. The external material or load undergoes a change in height, with the weight of the load attempting to force the conveyor to run faster than its design speed or to overhaul.
Non-overhauling loads require braking torque only to stop the load and will remain at rest due to system friction. Overhauling loads, such as a crane hoist, have two torque requirements. The first requirement is the braking torque required to stop the load, and the second requirement is the torque required to hold the load at rest. The sum of these requirements is considered when selecting a brake for an overhauling load.

## Alignment

Requirements per NEMA:
Permissible ECCENTRICITY of mounting rabbet (AK dimension):
42C to 286TC frames inclusive is $0.004^{\prime \prime}$ total indicator reading. 324TC to 505TC frames inclusive is 0.007 " total indicator reading.

Face Runout:
42C to 286TC frames inclusive is 0.004 " total indicator reading.
If a customer furnishes a face on the machine for brake mounting, the same tolerances apply. Floor mounted brakes must be carefully aligned within 0.005 " for concentricity and angular alignment. Use of dowels to insure permanent alignment is recommended.
In offset brake mount locations such as fan covers, cowls or jack shafting, proper mount rigidity and bearing support must be provided. Spring set frictional brakes characteristically have a rapid stop during torque application which may affect the mount surface or contribute to shaft deflection.
Printed installation information is published and available on all Stearns spring set brakes.

## Determining Brake Torque Torque ratings

Brake torque ratings are normally expressed as nominal static torque. That is, the torque required to begin rotation of the brake from a static, engaged condition. This value is to be distinguished from dynamic torque, which is the retarding torque required to stop a linear, rotating or overhauling load.

As a general rule, a brake's dynamic torque is approximately $80 \%$ of the static torque rating of the brake for stopping time up to one second. Longer stopping time will produce additional brake heat and possible fading (reduction) of dynamic torque. The required dynamic torque must be converted to a static torque value before selecting a brake, using the relationship:

$$
\mathrm{T}_{\mathrm{s}}=\frac{\mathrm{T}_{\mathrm{d}}}{0.8}
$$

Where, $\mathrm{T}_{\mathrm{s}}=$ Static torque, lb - ft
$T_{d}=$ Dynamic torque, lb-ft
$0.8=$ Constant
(derating factor)
All Stearns brakes are factory burnished and adjusted to produce no less than rated nominal static torque. Burnishing is the initial wear-in and mating of the rotating friction discs with the stationary metallic friction surfaces of the brake.

Although brakes are factory burnished and adjusted, variations in torque may occur if components are mixed when disassembling and reassembling the brake during installation. Further burnishing may be necessary after installation. Friction material will burnish under normal load conditions. Brakes used as holding only duty require friction material burnishing at or before installation to insure adequate torque.
When friction discs are replaced, the brake must be burnished again in order to produce its rated holding torque.

## System Friction

The friction and rolling resistance in a power transmission system is usually neglected when selecting a brake. With the use of anti-friction bearings in the system, friction and rolling resistance is usually low enough to neglect. Friction within the system will assist the brake in stopping the load. If it is desired to consider it, subtract the frictional torque from the braking torque necessary to decelerate and stop the load. Friction and rolling resistance are neglected in the examples presented in this guide.

## Non-overhauling Loads

There are two methods for determining brake torque for non-overhauling loads. The first method is to size the brake to the torque of the motor. The second is to select a brake on the basis of the total system or load inertia to be stopped.

## Selecting Brake Torque from the Motor Data

Motor full-load torque based or nameplate horsepower and speed can be used to select a brake. This is the most common method of selecting a brake torque rating due to its simplicity.

This method is normally used for simple rotary and linear inertial loads. Brake torque is usually expressed as a percent of the full load torque of the motor. Generally this figure is not less than $100 \%$ of the motor's full load torque. Often a larger service factor is considered. Refer to Selection of Service Factor.

The required brake torque may be calculated from the formula:

$$
T_{\mathrm{s}}=\frac{5,252 \times \mathrm{P}}{\mathrm{~N}} \times \mathrm{SF}
$$

Where, $\mathrm{T}_{\mathrm{s}}=$ Static brake torque, $\mathrm{lb}-\mathrm{ft}$

$$
\begin{aligned}
\mathrm{P} & =\text { Motor horsepower, hp } \\
\mathrm{N} & =\text { Motor full load speed, rpm } \\
\mathrm{SF} & =\text { Service factor } \\
5,252 & =\text { Constant }
\end{aligned}
$$

Match the brake torque to the hp used in the application. When an oversized motor hp has been selected, brake torque based on the motor hp may be excessive for the actual end use.
Nameplate torque represents a nominal static torque. Torque will vary based on combinations of factors including cycle rate, environment, wear, disc burnish and flatness. Spring set brakes provide a rapid stop and hold and are generally not used in repeat positioning applications.

## Selection of Service Factor

A service factor is applied to the basic drive torque calculation. The SF compensates for any tolerance variation, data inaccuracy, unplanned transient torque and potential variations of the friction disc.
When using the basic equation: $\mathrm{T}=(\mathrm{hp} \times 5252) / \mathrm{rpm}$ with nonoverhauling loads, a service factor of 1.2 to 1.4 is typical. Overhauling loads with unknown factors such as reductions may use a service factor of 1.4 to 1.8.

Spring set brakes combined with variable frequency drives use service factors ranging from 1.0 to 2.0 ( 2.0 for holding duty only) depending on the system design. These holding duty brakes must be wired to a separate dedicated power supply.

Occasionally, a brake with a torque rating less than the motor full load torque or with a service factor less than 1.0 is selected. These holding or soft stop applications must be evaluated by the end user or system designer to insure adequate sizing and thermal capacity.
Typically a brake rated $125 \%$ of the motor full load torque, or with a 1.25 service factor, provides a stop in approximately the same time as that required for the motor to accelerate the load to full load speed.

Occasionally a motor is oversized or undersized for the load or application. In these situations, the load inertia and desired stopping time calculations should be used rather than relying on the service factor method alone.

Service factor selection can be based on motor performance curves. Motor rotor and load inertia should be considered in this selection process. Depending on the motor design (NEMAA, B, C and D), rpm and horsepower, the maximum torque is either the starting or breakdown torque. A NEMA design B, 3 phase, squirrel cage design motor at breakdown torque produces a minimum of $250 \%$ the full load torque. A service factor of 2.5 would be selected. Typical service factors depending on NEMA motor design are: NEMA design A or B: 1.75 to 3.0, NEMA design C: 1.75 to 3.0 and NEMA design D: not less than 2.75.

A brake with an excessive service factor may result in system component damage, an unreasonably rapid stop or loss of load control. A SF above 2.0 is not recommended without evaluation by the end user or system designer.
Example 1: Select brake torque from motor horsepower and speed.

Given: Motor power (P) - 5 hp
Motor speed (N) - 1,750 rpm
Service factor (SF) - 1.4

$$
\begin{aligned}
\mathrm{T} & =\frac{5,252 \times \mathrm{P}}{\mathrm{~N}} \times \mathrm{SF} \\
& =\frac{5,252 \times 5}{1,750} \times 1.4 \\
\mathrm{~T} & =21 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

A brake having a standard rating of $25 \mathrm{lb}-\mathrm{ft}$ nominal static torque would be selected.

Example 2 illustrates selection of a brake to provide proper static torque to hold a load if dynamic braking were used to stop the load.

Example 2: Select a brake to hold a load in position after some other method, such as dynamic braking of the motor, has stopped all rotation.
Given: Weight of load (W)-5 lb
Drum radius (R) - 2 ft
Service factor (SF) - 1.4

The static holding torque is determined by the weight of the load applied at the drum radius. A service factor is applied to ensure sufficient holding torque is available in the brake.

$$
\begin{aligned}
\mathrm{T}_{\mathrm{S}} & =\mathrm{F} \times \mathrm{R} \times \mathrm{SF} \\
& =5 \times 2 \times 1.4 \\
\mathrm{~T}_{\mathrm{S}} & =14 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

## Sizing the Brake to the Inertial Load

For applications where the load data is known, where high inertial loads exist, or where a stop in a specified time or distance is required, the brake should be selected on the basis of the total inertia to be retarded. The total system inertia, reflected to the brake shaft speed, would be:

$$
\begin{aligned}
W \mathrm{k}_{\mathrm{T}}^{2}= & W \mathrm{k}_{\mathrm{B}}^{2}+\mathrm{W} \mathrm{k}_{\mathrm{M}}^{2}+\mathrm{W} \mathrm{k}_{\mathrm{L}}^{2} \\
\mathrm{~W} \text { here: } \mathrm{W} \mathrm{k}_{\mathrm{T}}^{2}= & \text { Total inertia reflected to } \\
& \text { the brake, } \mathrm{lb}-\mathrm{ft}^{2} \\
\mathrm{~W} \mathrm{k}_{\mathrm{B}}^{2}= & \text { Inertia of brake, } \mathrm{lb}-\mathrm{ft}^{2} \\
\mathrm{~W} \mathrm{k}_{\mathrm{M}}^{2}= & \text { Inertia of motor rotor, } \mathrm{lb}-\mathrm{ft}^{2} \\
\mathrm{~W} \mathrm{k}_{\mathrm{L}}^{2}= & \text { Equivalent inertia of } \\
& \text { load reflected to brake } \\
& \text { shaft, } \mathrm{lb}-\mathrm{ft}^{2}
\end{aligned}
$$

Other significant system inertias, including speed reducers, shafting, pulleys and drums, should also be considered in determining the total inertia the brake would stop.
If any component in the system has a rotational speed different than the rotational speed of the brake, or any linear moving loads are present, such as a conveyor load, their equivalent inertia in terms of rotary inertia at the brake rotational speed must be determined. The following formulas are applicable:

## Rotary motion:

$$
\begin{aligned}
& \text { Equivalent } \mathrm{Wk}_{\mathrm{B}}^{2}=\mathrm{Wk}_{\mathrm{L}}^{2}\left(\frac{\mathrm{~N}_{\mathrm{L}}}{\mathrm{~N}_{\mathrm{B}}}\right)^{2} \\
& \text { Where, } \\
& \text { Equivalent } W K_{B}^{2}=\text { Inertia of rotating } \\
& \text { load reflected to } \\
& \text { brake shaft, lb-ft }{ }^{2} \\
& W k_{L}^{2}=\text { Inertia of rotating } \\
& \text { load, lb-ft }{ }^{2} \\
& N_{L}=\text { Shaft speed } \\
& \text { at load, rpm } \\
& N_{B}=\text { Shaft speed } \\
& \text { at brake, rpm }
\end{aligned}
$$

## Horizontal Linear Motion

Equivalent $W k_{W}^{2}=W\left(\frac{V}{2 \pi N_{B}}\right)^{2}$

Where,

| Equivalent $\mathrm{Wk}_{\mathrm{W}}^{2}=$ | Equivalent inertia of |
| ---: | :--- |
|  | linear moving load |
|  | reflected to brake |
|  | shaft, $\mathrm{lb}-\mathrm{ft}^{2}$ |
| $\mathrm{~W}=$ | Weight of linear |
|  | moving load, lb |
| $\mathrm{V}=$ | Linear velocity |
|  | of load, ft/min |
| $\mathrm{N}_{\mathrm{B}}=$ | Shaft speed |
| at brake, rpm |  |

Once the total system inertia is calculated, the required average dynamic braking torque can be calculated using the formula:

$$
T_{d}=\frac{W k_{T}^{2} \times N_{B}}{308 \times t}
$$

Where, $T_{d}=$ Average dynamic braking torque, lb-ft

$$
\begin{aligned}
\mathrm{Wk}_{\mathrm{T}}^{2} & =\begin{array}{l}
\text { Total inertia reflected } \\
\\
\text { to brake, } \mathrm{lb}-\mathrm{ft}^{2}
\end{array} \\
\mathrm{~N}_{\mathrm{B}} & =\text { Shaft speed at } \\
& \text { brake, rpm } \\
\mathrm{t} & =\text { Desired stopping } \\
& \text { time, sec } \\
308 & =\text { Constant }
\end{aligned}
$$

The calculated dynamic torque is converted to the static torque rating using the relationship:

$$
T_{\mathrm{s}}=\frac{\mathrm{T}_{\mathrm{D}}}{0.8}
$$

Where, $\mathrm{T}_{\mathrm{s}}=\begin{aligned} & \text { Brake static } \\ & \text { torque, } \mathrm{lb}-\mathrm{ft}\end{aligned}$

$$
\mathrm{T}_{\mathrm{d}}=\underset{\text { torque, } \mathrm{lb}-\mathrm{ft}}{\text { System dynamic }}
$$

Examples 3, 4, 5 and 6 illustrate how brake torque is determined for nonoverhauling loads where rotary or horizontal linear motion is to be stopped.

Example 3: Select a brake to stop a rotating flywheel in a specified time.

Given, Motor speed $\left(\mathrm{N}_{\mathrm{M}}\right)-1,750 \mathrm{rpm}$
Motor inertia $\left(\mathrm{Wk}_{M}^{2}\right)-0.075 \mathrm{lb}-\mathrm{ft}^{2}$
Flywheel inertia ( $\mathrm{Wk}_{\mathrm{FW}}{ }^{2}$ ) - $4 \mathrm{lb}-\mathrm{ft}^{2}$
Brake inertia $\left(\mathrm{Wk}_{\mathrm{B}}^{2}\right)-0.042 \mathrm{lb}-\mathrm{ft}^{2}$
Required stopping time ( t ) -1 sec
First determine the total inertia to be stopped,

$$
\begin{aligned}
W k_{T}^{2} & =W k_{M}^{2}+W k_{F W}^{2}+W k_{B}^{2} \\
& =0.075+4+0.042 \\
W k_{T}^{2} & =4.117{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
\end{aligned}
$$

The dynamic braking torque required to stop the total inertia in 1 second is,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{d}} & =\frac{W \mathrm{~K}_{T}^{2} \times \mathrm{N}_{B M}}{308 \times \mathrm{t}} \\
& =\frac{4.117 \times 1,750}{308 \times 1} \\
\mathrm{~T}_{\mathrm{d}} & =23.4 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Converting $\mathrm{T}_{\mathrm{d}}$ to static torque

$$
\begin{aligned}
\mathrm{T}_{\mathrm{s}} & =\frac{\mathrm{T}_{\mathrm{d}}}{0.8} \\
& =\frac{23.4}{0.8} \\
\mathrm{~T}_{\mathrm{S}} & =29.3 \mathrm{lb-ft}
\end{aligned}
$$

A brake having a standard static torque rating of $35 \mathrm{lb}-\mathrm{ft}$ would be selected. Since a brake with more torque than necessary to stop the flywheel in 1 second is selected, the stopping time would be,

$$
\begin{aligned}
t= & \frac{W k_{T}^{2} \times N_{B M}}{308 \times T_{d}} \\
= & \frac{W k_{T}^{2} \times N_{B M}}{308 \times\left(0.8 \mathrm{~T}_{\mathrm{S}}\right)} \\
& \frac{4.117 \times 1,750}{308 \times(0.8 \times 35)} \\
t= & 0.84 \mathrm{sec}
\end{aligned}
$$

See section on Stopping Time and Thermal Information.
Example 4: Select a brake to stop a rotating flywheel, driven through a gear reducer, in a specified time.

Given: Motor speed ( $\mathrm{N}_{\mathrm{N}}$ ) - $1,800 \mathrm{rpm}$
Motor inertia $\left(W_{W}^{2}\right)-0.075 \mathrm{lb}-\mathrm{ft}^{2}$
Gear reduction (GR) - 20:1
Gear reducer inertia at high
speed shaft $\left(\mathrm{Wk}_{6 \mathrm{R}}^{2}\right)-0.025 \mathrm{lb}-\mathrm{ft}^{2}$
Flywheel inertia $\left(\mathrm{Wk}_{\mathrm{FW}}^{2}\right)-20 \mathrm{lb}-\mathrm{ft}^{2}$
Required stopping time (t) -
0.25 sec

First, determine rotating speed of flywheel ( $\mathrm{N}_{\mathrm{Fw}}$ )
$N_{F W}=\frac{N_{B M}}{G R}$

$$
=\frac{1,800}{20}
$$

$\mathrm{N}_{\mathrm{Fw}}=90 \mathrm{rpm}$

Next, the inertia of the flywheel must be reflected back to the motor brake shaft.

$$
\begin{aligned}
W k_{b}^{2} & =W k_{F W}^{2}\left(\frac{N_{F W}}{N_{M}}\right)^{2} \\
& =20\left(\frac{90}{1,800}\right)^{2}
\end{aligned}
$$

$$
W k_{b}^{2}=0.05{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
$$

Determining the total $W \mathbf{k}^{2}$,

$$
\begin{aligned}
W k_{T}^{2} & =W k_{M}^{2}+W k_{G R}^{2}+W k_{b}^{2} \\
& =0.075+0.025+0.05 \\
W k_{T}^{2} & =0.15{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
\end{aligned}
$$

The required dynamic torque to stop the flywheel in 0.25 seconds can now be determined.

$$
\begin{aligned}
& T_{d}=\frac{W k_{T}^{2} \times N_{B M}}{308 \times t} \\
& T_{d}=\frac{0.15 \times 1,800}{308 \times 0.25} \\
& T_{d}=3.5 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Converting dynamic torque to static torque,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{s}} & =\frac{\mathrm{T}_{\mathrm{d}}}{0.8} \\
& =\frac{3.5}{0.8}
\end{aligned}
$$

$\mathrm{T}_{\mathrm{s}}=4.4 \mathrm{lb}-\mathrm{ft}$
A brake having a standard static torque rating of 6 lb -ft would be selected. Since a brake with more torque than necessary to stop the flywheel in 0.25 seconds is selected, the stopping time would be,
$t=\frac{W k_{T}^{2} \times N_{M}}{308 \times T_{d}}$
$=\frac{W \mathrm{Kk}_{\mathrm{T}}^{2} \times \mathrm{N}_{\mathrm{M}}}{308 \times\left(0.8 \times \mathrm{T}_{\mathrm{s}}\right)}$
$=\frac{0.15 \times 1,800}{308 \times(0.8 \times 6)}$
$\mathrm{t}=0.18 \mathrm{sec}$
See section on Stopping Time and Thermal Information.
Example 5: Select a brake to stop a load on a horizontal belt conveyor in a specified time.

## Given:

Conveyor pulley speed ( $\mathrm{N}_{\mathrm{p}}$ ) - 32 rpm
Weight of load (W) - 30 lb
Conveyor pulley and belt inertia
( $\mathrm{W} \mathrm{K}_{\mathrm{p}}^{2}$ ) - $4.0 \mathrm{lb}-\mathrm{ft}^{2}$
Conveyor pulley diameter $\left(\mathrm{d}_{\mathrm{p}}\right)-1 \mathrm{ft}$
Required stopping time ( t ) -0.25 sec

First, convert the rotational pulley speed to linear belt speed $\left(V_{B}\right)$.
$V_{B}=\pi d_{p} N_{p}$

$$
\begin{aligned}
& =\pi \times 1 \times 32 \\
\mathrm{~V}_{\mathrm{B}} & =100.5 \mathrm{ft} / \mathrm{min}
\end{aligned}
$$

Next, determine inertia of load.

$$
\begin{aligned}
\begin{aligned}
W k_{W}^{2} & =W\left(\frac{V_{B}}{2 \pi \times N_{p}}\right)^{2} \\
& =30\left(\frac{100.5}{2 \pi \times 32}\right)^{2} \\
W_{W}^{2} & =7.5 \mathrm{ft}-\mathrm{lb}^{2}
\end{aligned}
\end{aligned}
$$

Then, determine total inertial load

$$
\begin{aligned}
W_{k_{T}^{2}} & =W k_{W}^{2}+W k_{P}^{2} \\
& =7.5+4.0 \\
W k_{T}^{2} & =11.5{\mathrm{lb}-\mathrm{ft}^{2}}^{\text {an }}
\end{aligned}
$$

The required dynamic torque to stop the conveyor load in 0.25 seconds can now be determined.
$\mathrm{T}_{\mathrm{d}}=\frac{\mathrm{W} \mathrm{K}_{\mathrm{T}}^{2} \times \mathrm{N}_{\mathrm{p}}}{308 \times \mathrm{t}}$
$T_{d}=\frac{11.5 \times 32}{308 \times 0.25}$
$\mathrm{T}_{\mathrm{d}}=4.8 \mathrm{lb-ft}$
Converting dynamic torque to static torque,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{S}} & =\frac{\mathrm{T}_{\mathrm{d}}}{0.8} \\
& =\frac{4.8}{0.8} \\
\mathrm{~T}_{\mathrm{S}} & =6 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

A brake having a standard static torque rating of $6 \mathrm{lb}-\mathrm{ft}$ would be selected. See Thermal Information.
Example 6: Select a brake to stop a trolley crane and its load in a specified time. Brake mounted on wheel axle.

## Given:

Weight of crane $\left(W_{c}\right)-2,000 \mathrm{lb}$
Weight of load $\left(W_{L}\right)-100 \mathrm{lb}$
Trolley velocity ( V ) - $3 \mathrm{ft} / \mathrm{sec}$ or $180 \mathrm{ft} / \mathrm{min}$
Radius of trolley wheel ( r ) -0.75 ft
Required stopping time ( t ) - 2 sec

The dynamic braking torque required to stop the trolley crane and load can be determined by one of two methods. The first method is to determine the equivalent inertia of the linearly moving crane and load, then calculate the dynamic braking torque. The second method is to determine the dynamic braking torque directly.
Using the first method, the total weight to be stopped is determined first.

$$
\begin{aligned}
W_{T} & =W_{L}+W_{C} \\
& =100+2,000 \\
W_{T} & =2,100 \mathrm{lb}
\end{aligned}
$$

Next, the rotational speed of the axle $\left(\mathrm{N}_{\mathrm{B}}\right)$ is calculated.

$$
\begin{aligned}
N_{B} & =\frac{V}{2 \pi r} \\
& =\frac{180}{2 \times \pi \times 0.75} \\
N_{B} & =38.2 \mathrm{rpm}
\end{aligned}
$$

Then, the equivalent inertia of the linearly moving crane and load is determined.

$$
\begin{aligned}
W K_{T}^{2} & =W_{T}\left(\frac{V}{2 \pi N_{B}}\right)^{2} \\
& =2,100\left(\frac{180}{2 \pi 38.2}\right)^{2}
\end{aligned}
$$

$\mathrm{Wk}_{\mathrm{T}}^{2}=1,181 \mathrm{lb}-\mathrm{ft}^{2}$
Finally, the dynamic braking torque required to stop the total inertia in 2 seconds is,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{d}} & =\frac{\mathrm{W} \mathrm{k}_{\mathrm{T}} \times \mathrm{N}_{\mathrm{B}}}{308 \times \mathrm{t}} \\
& =\frac{1,181 \times 38.2}{308 \times 2} \\
\mathrm{~T}_{\mathrm{d}} & =73 \mathrm{lb-ft}
\end{aligned}
$$

Using the second method, the dynamic braking torque required to stop the crane and load in 2 seconds can be calculated directly using the formula,

$$
\left.\begin{array}{rl}
\mathrm{T}_{\mathrm{d}}= & \frac{\mathrm{W}_{\mathrm{T}}^{\mathrm{v}}}{\mathrm{gt}} \times \mathrm{r} \\
\text { Where, } \mathrm{T}_{\mathrm{d}}= & \text { Average dynamic } \\
& \text { braking torque, lb-ft } \\
\mathrm{W}_{\mathrm{t}}= & \text { Total weight of linear } \\
& \text { moving load, Ib } \\
\mathrm{v}= & \text { Linear velocity of load, } \\
& \mathrm{ft} / \mathrm{sec} \\
\mathrm{~g}= & \text { Gravitational acceleration } \\
& \text { constant, } 32.2 \mathrm{ft} / \mathrm{sec}^{2}
\end{array}\right\} \begin{aligned}
\mathrm{t}= & \text { Desired stopping time, } \\
& \text { sec } \\
\mathrm{r}= & \text { Length of the moment } \\
& \text { arm (wheel radius), } \mathrm{ft}
\end{aligned}
$$

or, for this example,

$$
\begin{aligned}
& \mathrm{T}_{\mathrm{d}}=\frac{2,100 \times 3}{32.2 \times 2} \times .75 \\
& \mathrm{~T}_{\mathrm{d}}=73 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

For both methods above, the required dynamic braking torque is converted to static torque,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{s}} & =\frac{\mathrm{T}_{\mathrm{d}}}{0.8} \\
& =\frac{73}{0.8} \\
\mathrm{~T}_{\mathrm{s}} & =91 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

A smaller brake could be mounted on the high speed shaft in place of the higher torque on the low speed shaft.

A brake having a standard static torque rating of $105 \mathrm{lb}-\mathrm{ft}$ is selected. Since a brake with more torque than necessary to stop the load in 2 seconds is selected, the stopping time would be,

$$
\begin{aligned}
T & =\frac{W_{T}^{v}}{g T_{d}} \times r \\
& =\frac{W_{T} v}{g \times\left(0.8 \times T_{s}\right)} \times r \\
& =\frac{2,100 \times 3}{32.2 \times(0.8 \times 105)} \times 0.75 \\
t & =1.8 \mathrm{sec}
\end{aligned}
$$

See section on Stopping Time and cycle rates, Thermal Selection. Stops should be under 2 seconds. Longer stops require application test.

## Overhauling Loads

Applications with a descending load, such as power lowered crane, hoist or elevator loads, require a brake with sufficient torque to both stop the load, and hold it at rest. Overhauling loads having been brought to rest still invite motion of the load due to the effect of gravity. Therefore, brake torque must be larger than the overhauling torque in order to stop and hold the load. If brake torque is equal to or less than the overhauling torque, there is no net torque available for stopping a descending load.

First, the total system inertia reflected to the brake shaft speed must be calculated.

Second, the average dynamic torque required to decelerate the descending load in the required time is calculated with the formula:

$$
T_{d}=\frac{W k_{T}^{2} \times N_{B}}{308 \times t}
$$

Where, $T_{d}=$ Average dynamic braking torque, lb-ft

$$
\left.\begin{array}{rl}
W \mathrm{~K}_{\mathrm{T}}^{2}= & \text { Total inertia reflected } \\
& \text { to brake, } \mathrm{lb}-\mathrm{ft}^{2}
\end{array}\right\} \begin{aligned}
\mathrm{N}_{\mathrm{B}}= & \text { Shaft speed at brake, rpm. } \\
& \text { Consider motor slip when } \\
& \text { descending. } \\
\mathrm{t}= & \text { Desired stopping time, } \\
& \mathrm{sec}
\end{aligned}
$$

Third, the overhauling torque reflected to the brake shaft is determined by the formula:

$$
\begin{aligned}
\mathrm{T}_{\mathrm{o}}= & \mathrm{W} \times \mathrm{R} \times \frac{\mathrm{N}_{\mathrm{L}}}{\mathrm{~N}_{\mathrm{B}}} \\
\text { Where, } \mathrm{T}_{\mathrm{o}}= & \text { Overhauling dynamic } \\
& \begin{array}{l}
\text { torque of load reflected to } \\
\\
\text { brake shaft, } \mathrm{lb}-\mathrm{ft}
\end{array} \\
\mathrm{~W}= & \begin{array}{l}
\text { Weight of overhauling } \\
\\
\text { load, } \mathrm{lb}
\end{array} \\
\mathrm{R}= & \begin{array}{l}
\text { Radius of hoist or } \\
\text { elevator drum, ft }
\end{array} \\
\mathrm{N}_{\mathrm{L}}= & \underset{\substack{\text { Rotating speed of drum }, \mathrm{rpm}}}{\mathrm{~N}_{\mathrm{B}}=} \begin{array}{l}
\text { Rotating speed at brake, } \\
\mathrm{rpm}
\end{array}
\end{aligned}
$$

Or alternately, the dynamic torque to overcome the overhauling load can be calculated with the formula:

$$
T_{0}=\frac{0.158 \times W \times V}{N_{B}}
$$

Where, $\mathrm{T}_{0}=$ Overhauling dynamic torque of load reflected to brake shaft, lb-ft

$$
\begin{aligned}
\mathrm{W}= & \text { Weight of overhauling } \\
& \text { load, } \mathrm{Ib} \\
\mathrm{~V}= & \text { Linear velocity of } \\
& \text { descending load, } \mathrm{ft} / \mathrm{min} \\
\mathrm{~N}_{\mathrm{B}} & =\text { Shaft speed at brake, rpm } \\
0.158 & =\text { Constant }
\end{aligned}
$$

Next, the total dynamic torque required to stop and hold the overhauling load is the sum of the two calculated dynamic torques:

$$
T_{t}=T_{d}+T_{0}
$$

Finally, the dynamic torque must be converted to static brake torque to select a brake:

$$
T_{s}=\frac{T_{d}}{0.8}
$$

Where, $\mathrm{T}_{\mathrm{s}}=$ Brake static torque, lb-ft

$$
T_{t}=\text { System dynamic }
$$

torque, lb-ft

If the total inertia of the system and overhauling load cannot be accurately determined, a brake rated at 180\% the motor full load torque should be selected. Refer to Selection of Service Factor. The motor starting torque may permit a heavier than rated load to be lifted; the brake must stop the load when descending.
Examples 7, 8 and 9 illustrate how brake torque would be determined for overhauling loads. In these examples brakes are selected using the system data rather than sizing them to the motor. Refer to the section on Thermal Calculations to determine cycle rate.

Consider motor slip in calculation. An 1800 rpm motor with $10 \%$ slip would operate at $1,620 \mathrm{rpm}$ when the load is ascending and $1,980 \mathrm{rpm}$ when descending. Motor rpm, armature inertia and load position will affect stop time. Brakes on overhauling loads should be wired through a dedicated relay.
Example 7: Select a brake to stop an overhauling load in a specified time.

Given: Cable speed (V)-667 ft/min
Weight of load (W) - 100 lb
Drum diameter (D) - 0.25 ft
Drum inertia (Wk ${ }_{\mathrm{D}}^{2}$ ) - $5 \mathrm{lb}-\mathrm{ft}^{2}$
Required stopping time ( t ) -1 sec
First, determine brakemotor shaft speed ( $\mathrm{N}_{\mathrm{B}}$ ).

$$
\begin{aligned}
N B & =\frac{V}{\pi D} \\
& =\frac{667}{\pi \times 0.25}
\end{aligned}
$$

$$
\mathrm{NB}=849 \mathrm{rpm}
$$

Then, determine the equivalent inertia of the overhauling load.

$$
\begin{aligned}
W k_{\mathrm{I}}^{2} & =\mathrm{W}\left(\frac{\mathrm{~V}}{2 \pi \mathrm{~N}_{\mathrm{B}}}\right)^{2} \\
& =100\left(\frac{667}{2 \pi \times 849}\right)^{2} \\
\mathrm{Wk}_{\mathrm{I}}^{2} & =1.56 \mathrm{lb-ft}^{2}
\end{aligned}
$$

Therefore, the total inertia at the brake is,

$$
\begin{aligned}
\mathrm{Wk}_{\mathrm{T}}^{2} & =\mathrm{W} \mathrm{k}_{\mathrm{D}}^{2}+\mathrm{Wk}_{\mathrm{I}}^{2} \\
& =5+1.56 \\
\mathrm{Wk}_{\mathrm{T}}^{2} & =6.56 \mathrm{lb}-\mathrm{ft}^{2}
\end{aligned}
$$

Now, the dynamic torque required to decelerate the load and drum in the required time is calculated.

$$
\begin{aligned}
\mathrm{T}_{\mathrm{d}} & =W \mathrm{~K}_{\mathrm{T}}^{2} \times \mathrm{N}_{\mathrm{B}} \\
& =\frac{6.56 \times 850}{308 \times 1} \\
\mathrm{~T}_{\mathrm{d}} & =18.1 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Next, calculate the dynamic torque required to overcome the overhauling load.

$$
\begin{aligned}
\mathrm{T}_{0} & =\mathrm{W} \times \mathrm{R} \\
& =100 \times \frac{0.25}{2} \\
\mathrm{~T}_{0} & =12.5 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

The total dynamic torque to stop and hold the overhauling load is the sum of the two calculated dynamic torques.

$$
\begin{aligned}
\mathrm{T}_{\mathrm{t}} & =\mathrm{T}_{\mathrm{d}}+\mathrm{T}_{\mathrm{o}} \\
& =18.1+12.5 \\
\mathrm{~T}_{\mathrm{t}} & =30.6 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Dynamic torque is then converted to static torque.

$$
\begin{aligned}
\mathrm{T}_{\mathrm{s}} & =\frac{\mathrm{T}_{\mathrm{t}}}{0.8} \\
& =\frac{30.6}{0.8} \\
\mathrm{~T}_{\mathrm{s}} & =38.3 \mathrm{lb-ft}
\end{aligned}
$$

A brake having a standard torque rating of $50 \mathrm{lb}-\mathrm{ft}$ is selected based on expected stop time. Since a brake with more torque than necessary to stop the load in 1 second is selected, the stopping time would be,

$$
\begin{aligned}
\mathrm{t} & =\frac{W K_{T}^{2} \times N}{308 \times T_{\mathrm{d}}} \\
\text { where, } \quad T_{\mathrm{s}} & =\frac{T_{\mathrm{t}}}{0.8} \\
& =\frac{T_{\mathrm{d}}+T_{0}}{0.8} \\
\text { or, } \quad T_{d} & =0.8 T_{\mathrm{s}}-\mathrm{T}_{0} \\
& =(0.8)(50)-12.5 \\
\mathrm{~T}_{\mathrm{d}} & =27.5 \mathrm{lb}-\mathrm{ft} \\
\text { therefore, } \quad \mathrm{t} & =\frac{6.56 \times 850}{308 \times 27.5} \\
\mathrm{t} & =0.7 \mathrm{sec}
\end{aligned}
$$

Wire the brake through a dedicated relay on overhauling loads where stop time or distance is critical. See section on Stopping time.
Example 8: Select a brake to stop an overhauling load driven through gear reducer in a specified time.

Given: Motor speed $\left(\mathrm{N}_{\mathrm{M}}\right)-1,150 \mathrm{rpm}$
Motor inertia (WK ${ }_{(0)}^{2}$ ) - $0.65 \mathrm{lb}-\mathrm{ft}^{2}$
Gear reduction (GR) - 300:1
Drum diameter (D) -1.58 ft
Weight of load (W) - 4,940 lb
Drum inertia (WK ${ }^{2}$ ) - $600 \mathrm{lb-ft}{ }^{2}$
Required stopping time (t) - 0.5 sec

First, calculate all inertial loads reflected to the brakemotor shaft.

The rotational speed of the drum is,

$$
\begin{aligned}
\mathrm{N}_{\mathrm{D}} & =\frac{\mathrm{N}_{\mathrm{M}}}{\mathrm{GR}} \\
& =\frac{1,150}{300} \\
\mathrm{~N}_{\mathrm{D}} & =3.83 \mathrm{rpm}
\end{aligned}
$$

From this, the cable speed can be determined.

$$
\begin{aligned}
V & =N_{D} \times \pi D \\
& =3.83 \times \pi \times 1.58 \\
V & =19.0 \mathrm{ft} / \mathrm{min}
\end{aligned}
$$

The equivalent inertia of the load reflected to the brakemotor shaft is,

$$
\begin{aligned}
\mathrm{Wk}_{\mathrm{I}}^{2} & =\mathrm{W}\left(\frac{\mathrm{~V}}{2 \pi \mathrm{~N}_{\mathrm{BM}}}\right)^{2} \\
& =4,940\left(\frac{19.0}{2 \pi 1,150}\right)^{2} \\
\mathrm{Wk}_{\mathrm{I}}^{2} & =0.034{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
\end{aligned}
$$

The equivalent inertia of the drum at the brakemotor shaft speed is,

$$
\begin{aligned}
W k_{d}^{2} & =W k_{0}^{2}\left(\frac{N_{\mathrm{D}}}{N_{\text {BM }}}\right)^{2} \\
& =600\left(\frac{3.83}{1,150}\right)^{2}
\end{aligned}
$$

Finally, the total inertia the brake will retard is,

$$
\begin{aligned}
& \mathrm{Wk}_{T}^{2}=\mathrm{Wk}_{\mathrm{M}}^{2}+\mathrm{Wk}_{\mathrm{I}}^{2}+\mathrm{Wk}_{\mathrm{d}}^{2} \\
& \mathrm{Wk} \mathrm{k}_{\mathrm{T}}^{d}=0067 \mathrm{lb}-\mathrm{ft}^{2} \\
& \mathrm{Wk}_{\mathrm{T}}^{2}=0.691{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
\end{aligned}
$$

The dynamic torque required to decelerate the total inertia is,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{d}} & =\frac{W k_{1}^{2} \times N_{B M}}{308 \times t} \\
& =\frac{0.691 \times 1,150}{308 \times 0.5} \\
\mathrm{~T}_{\mathrm{d}} & =5.16{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
\end{aligned}
$$

Now, calculate the dynamic torque to overcome the overhauling load.

$$
\begin{aligned}
T_{0} & =W \times R=W \times 1 / 2 D \\
& =4,940 \times \frac{1.58}{2}
\end{aligned}
$$

$$
\mathrm{T}_{0}=3,903 \mathrm{lb}-\mathrm{ft}
$$

Which reflected to the brakemotor shaft becomes,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{m}} & =\frac{\mathrm{T}_{\mathrm{o}}}{\mathrm{GR}} \\
& =\frac{3,903}{300} \\
\mathrm{~T}_{\mathrm{m}} & =13.0 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Then, the total dynamic torque to stop and hold the overhauling load is the sum of the two calculated dynamic torques.

$$
\begin{aligned}
T_{t} & =T_{d}+T_{m} \\
& =5.16+13.0 \\
T_{t} & =18.16 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Dynamic torque is then converted to static torque.

$$
\begin{aligned}
T_{S} & =\frac{T_{t}}{0.8} \\
& =\frac{18.16}{0.8}
\end{aligned}
$$

$$
\mathrm{T}_{\mathrm{s}}=22.7 \mathrm{lb-ft}
$$

A brake having a standard torque rating of $25 \mathrm{lb}-\mathrm{ft}$ is selected.
Example 9: Select a brake to stop and hold a load on an inclined plane (skip hoist).

Given: Motor data
Power (P) - $71 / 2 \mathrm{hp}$
Speed ( $\mathrm{N}_{\mathrm{M}}$ ) - 1,165 rpm
Rotor inertia (WK ${ }_{5}^{2}$ ) $-1.4 \mathrm{lb}-\mathrm{ft}^{2}$

## Gear reducer data:

Reduction ( $G_{R}$ ) - 110:1
Inertia at input shaft
( $W \mathrm{~K}^{2}$ ) - $0.2 \mathrm{lb-ft}^{2}$
Drum data
Diameter ( $\mathrm{D}_{\mathrm{D}}$ ) - 1.5 ft
Inertia (Wk ${ }^{2}$ ) - 75 lb - $\mathrm{tt}^{2}$

## Pulley data

Diameter ( $\mathrm{D}_{\mathrm{P}}$ ) - 1.5 ft
Inertia ( $\mathrm{Wk}_{\mathrm{p}}^{2}$ ) - 20 lb - $\mathrm{ft}^{2}$
Bucket weight $\left(W_{B}\right)-700 \mathrm{lb}$
Maximum weight of load (WL) - 4,000 lb
Slope of track (B) $-52.7^{\circ}$

Required stopping time ( t ) -1 sec
The bucket is full when ascending the track and is empty when descending. When selecting a brake the most severe condition would be a fully loaded bucket backed down the hoist track. In normal operation the descending bucket would be empty. In this example, the brake is selected for the most severe condition.
The total torque to stop and hold the bucket and load when descending is the sum of (a) the torque to decelerate the total inertia and (b) the torque required to hold the loaded bucket.

First, calculate all inertial loads reflected to the brakemotor shaft. The rotational speed of the drum is:

$$
\begin{aligned}
N_{D} & =\frac{N_{M}}{G R} \\
& =\frac{1,165}{110} \\
N_{D} & =10.6 \mathrm{rpm}
\end{aligned}
$$

From this the cable speed can be determined

$$
\begin{aligned}
V & =N_{D} \times \pi D_{D} \\
& =10.6 \times \pi \times 1.5 \\
V & =50 \mathrm{ft} / \mathrm{min}
\end{aligned}
$$

The equivalent inertia of the loaded bucket reflected to the brakemotor shaft is,

$$
\begin{aligned}
\mathrm{Wk}_{\mathrm{I}}^{2} & =\mathrm{W}\left(\frac{\mathrm{~V}}{2 \pi \mathrm{~N}_{\mathrm{M}}}\right)^{2} \\
& =4,700\left(\frac{50}{2 \pi \times 1,165}\right)^{2} \\
\mathrm{Wk}_{\mathrm{I}}^{2} & =0.219{\mathrm{lb}-\mathrm{ft}^{2}}^{2}
\end{aligned}
$$

Next, the inertia of the pulley and drum are reflected to the brake motor shaft speed so the total inertia at the brake can be determined.
Since the diameters of the pulley and drum are the same, 1.5 ft , their rotational speeds would be the same, 10.6 rpm .
The inertia of the pulley reflected to the brakemotor shaft is,

$\mathrm{W} \mathrm{k}_{\mathrm{p}}^{2}=0.0017 \mathrm{lb}-\mathrm{ft}^{2}$
The inertia of the drum reflected to the brakemotor shaft is,

The total inertia to be stopped is,

$$
\begin{aligned}
W k_{T}^{2} & =W k_{\mathrm{I}}^{2}+W k_{\mathrm{P}}^{2}+W k_{\mathrm{d}}^{2}+W k_{R}^{2}+W k_{M}^{2} \\
& =0.219+0.0017+0.0062+0.2+1.4 \\
W k_{T}^{2} & =1.827 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Then, the dynamic torque required to bring the descending bucket and load to rest is,

$$
\begin{aligned}
& T_{d}=\frac{W k_{T}^{2} \times N_{M}}{308 \times T_{d}} \\
& T_{d}=\frac{1.827 \times 1,165}{308 \times 1}
\end{aligned}
$$

The additional dynamic torque required to hold the overhauling load would be determined by the unbalanced component of the force acting along the plane of the hoist track, $\mathrm{W}_{\mathrm{T}} \sin B$, and the length of the moment arm which is the drum radius $\left(R_{D}\right) . W_{T} \sin B$ is the force necessary to retard downward motion of the loaded hoist bucket.

$$
\begin{aligned}
T_{0} & =W_{T} \sin B \times R_{D} \\
& =W_{T} \sin B \times 1 / 2 D_{D} \\
& =4,700 \times \sin 52.7^{\circ} \times 1 / 2(1.5) \\
& =4,700 \times 0.7955 \times 0.75 \\
T_{0} & =2,804 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Which reflected to the brakemotor shaft becomes,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{m}} & =\frac{\mathrm{T}_{\mathrm{o}}}{\mathrm{GR}} \\
& =\frac{2,804}{110} \\
\mathrm{~T}_{\mathrm{m}} & =25.5 \mathrm{lb-ft}
\end{aligned}
$$

Then, the total dynamic torque to stop and hold the descending bucket and load is the sum of the two calculated dynamic torques.

$$
\begin{aligned}
\mathrm{T}_{\mathrm{t}} & =\mathrm{T}_{\mathrm{d}}+\mathrm{T}_{\mathrm{m}} \\
& =6.9+25.5 \\
\mathrm{~T}_{\mathrm{t}} & =32.4 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Converting to static torque,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{s}} & =\frac{\mathrm{T}_{\mathrm{t}}}{0.8} \\
& =\frac{32.4}{0.8} \\
\mathrm{~T}_{\mathrm{s}} & =40.5 \mathrm{lb-ft}
\end{aligned}
$$

A brake having a standard torque rating of $50 \mathrm{lb}-\mathrm{ft}$ is selected. Since a brake with more torque than necessary to stop the load in 1 second is selected, the stopping time would be,

$$
\begin{aligned}
& t=\frac{W_{T} \times N_{M}}{308 \times T_{d}} \\
& \text { Where, } T_{s}=\frac{T_{1}}{0.8} \\
&=\frac{T_{d}+T_{m}}{0.8} \\
& \text { or, } T_{d}=0.8 T_{\mathrm{s}}-T_{\mathrm{m}} \\
&=(0.8)(50)-25.5 \\
& T_{d}=14.5 \mathrm{lb}-\mathrm{ft} \\
& \text { therefore, } \\
& t=\frac{1.827 \times 1,165}{308 \times 14.5} \\
& t=0.48 \mathrm{sec}
\end{aligned}
$$

See section on Stopping time.

## Stopping Time and Deceleration Rate

In the formulas used to determine dynamic torque, stopping time or " t " in seconds is a desired or assumed value selected on the requirements of the application. For optimum brake performance, a stopping or braking time of 1 second or less is desirable. Stop times between 2 and 3 seconds require test. A brake of insufficient torque rating will lengthen the stopping time. This may result in overheating of the brake to a point where torque falls appreciably. The friction material could carbonize, glaze, or fail.
After determining the braking torque required by a system, it may be necessary to recalculate the stopping time based on the actual brake size selected to insure that stopping time falls within the 0 to 2 second range. Any formula, where the stopping time is a variable, may be rewritten to solve for the new stopping time. For instance, the dynamic torque equation may be transposed as follows:

$$
\begin{aligned}
T_{d} & =\frac{W k_{T}^{2} \times N_{B}}{308 \times t} \\
\text { or, } \quad t & =\frac{W k_{T}^{2} \times N_{B}}{308 \times\left(0.8 \times T_{S}\right)}
\end{aligned}
$$

Where, $t=$ Stopping time, sec

$$
\begin{aligned}
\mathrm{Wk}_{\mathrm{T}}^{2}= & \text { Total inertia reflected } \\
& \text { to brake, lb-ft } \\
\mathrm{N}_{\mathrm{B}}= & \text { Shaft speed at brake, rpm } \\
\mathrm{T}_{\mathrm{S}}= & \text { Nominal static torque } \\
& \text { rating of brake, } \mathrm{lb}-\mathrm{ft} \\
\mathrm{~T}_{\mathrm{C}}= & \text { Dynamic braking torque } \\
& \left(0.8 \times \mathrm{T}_{\mathrm{S}}\right), \mathrm{lb}-\mathrm{ft} \\
0.8= & \text { Constant (derating factor) } \\
308= & \text { Constant }
\end{aligned}
$$

Brakes are rated in static torque. This value is converted to dynamic torque, as done in the above equation, when stopping time is calculated. That is,

$$
\mathrm{T}_{\mathrm{d}}=0.8 \times \mathrm{T}_{\mathrm{s}}
$$

Where, $T_{d}=$ Dynamic braking torque , lb-ft
$\mathrm{T}_{\mathrm{S}}=$ Nominal static torque rating of brake, lb-ft

The approximate number of revolutions the brake shaft makes when stopping is:
Revolutions to stop $=\frac{t \times N_{B}}{120}$
Where, $t=$ Stopping time, sec

$$
\begin{aligned}
N_{\mathrm{B}} & =\text { Shaft speed at brake, rpm } \\
120 & =\text { Constant }
\end{aligned}
$$

The average rate of deceleration when braking a linearly moving load to rest can be calculated using the stopping time determined by the above formula and the initial linear velocity of the load.

$$
a=-\frac{V_{i}}{t}
$$

Where, $\mathrm{a}=$ Deceleration, $\mathrm{ft} / \mathrm{sec}^{2}$

$$
\begin{aligned}
V_{i} & =\text { Initial linear velocity of } \\
& \text { load, ft/sec } \\
t & =\text { Stopping time, sec }
\end{aligned}
$$

## RPM Considerations

The maximum allowable rotational speed of the brake should not be exceeded in braking. Maximum brake rpm as listed in the catalog is intended to limit stopping time to 2 seconds or less and insure friction disc stability. Brakes are not dynamically balanced because of the low brake inertia.

## Determining Required Thermal Capacity

## Thermal Ratings

When a brake stops a load, it converts mechanical energy to thermal energy or heat. The heat is absorbed by components of the brake. This heat is then dissipated by the brake. The ability of a given brake to absorb and dissipate heat without exceeding temperature limitations is known as thermal capacity.
There are two categories of thermal capacity for a brake. The first is the maximum energy the brake can absorb in one stop, generally referred to as a "crash" or "emergency" stop. The second is the heat dissipation capability of the brake when it is cycled frequently. To achieve optimum brake performance, the thermal rating should not be exceeded. They are specified for a predetermined maximum temperature rise of the brake friction material.
The ability of a brake to absorb and dissipate heat is determined by many factors, including the design of the brake, the ambient temperature, brake enclosure, position of the brake, the surface that the brake is mounted to, and the altitude.

The rating for a given brake is the maximum allowable. Longer brake life results when the brake has more thermal capacity than a power transmission requires. Much shorter life or brake failure will result when the thermal capacity rating is exceeded. Ratings are determined at an ambient temperature of $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$, with the brake in a horizontal position, with a stopping time of 1 second or less, and with no external heat source such as a motor.

Ambient temperature will limit the thermal capacity of a brake. Temperatures above $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ require derating of the thermal capacity rating. For example, at $150^{\circ} \mathrm{F}$, thermal capacity is reduced approximately 30\% (see Derating Thermal Capacity Chart).

## CHART: Derating Thermal Capacity

A temperature range of $20^{\circ} \mathrm{F}\left(-7^{\circ} \mathrm{C}\right)$ to $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$ is acceptable in most brake applications. Above $104^{\circ} \mathrm{F}$ also consider Class H coil insulation.
Thermal capacity ratings are determined with enclosures on the brake. Other customer furnished covers or cowls may affect a brake's thermal capacity. The effect on thermal capacity should be evaluated. In some cases, thermal capacity may be increased by use of air or liquid cooling. However, provisions must be made to prevent contaminating the brake internally.
Brakes with brass stationary discs are derated $25 \%$.

The mounting position of a brake will also affect thermal capacity. The specified ratings are for brakes mounted in a horizontal position with the solenoid plunger above the solenoid. For brakes mounted in a vertical position, or $15^{\circ}$ or more from horizontal, the thermal capacity decreases due to friction disc drag. Brakes are modified for vertical operation to minimize the drag. 2 - and 3 - disc brakes are derated $25 \%$, 4 -disc brakes are derated $33 \%$. 4 - and 5 -disc brakes are not recommended for vertical use.

Thermal capacity ratings are established without external sources of heat increasing the brake temperature. The surface that a brake is mounted to, such as an electric
motor or gear reducer, will limit the heat dissipation capability or thermal capacity of a brake. These sources of heat should be evaluated when determining the thermal requirements of the system for which the brake is selected.

High altitudes may also affect a brake's thermal capacity. Stearns brakes will operate to $10,000 \mathrm{ft}$ above sea level at $72^{\circ} \mathrm{F}\left(22^{\circ} \mathrm{C}\right)$ ambient temperature. At $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$ ambient temperature, altitude and temperature adjustments occur. Refer to NEMA MG1-1993 Section 14 for additional information.
CHART: Altitude \& Thermal Capacity

## Maximum Energy Absorption

The thermal capacity of a brake is limited by the maximum energy it can absorb in one stop. This factor is important when stopping extremely high inertial loads at infrequent intervals. Such use of a brake requires extensive cooling time before it can be operated again.

The energy a brake is required to absorb in one stop by a given power transmission system is determined by the formulas below. The calculated energy of the system should not exceed the maximum kinetic energy rating of the brake. System energy exceeding the brake's maximum rating may result in overheating of the brake to a point where torque falls appreciably. The friction material of the brake could glaze, carbonize or fail.
In the case of linear loads, the energy that the brake must absorb is kinetic energy. It is determined by the formula:

$$
\begin{aligned}
\mathrm{KE}_{\mathrm{I}} & =\frac{\mathrm{W}_{\mathrm{v}^{2}}^{2}}{2 \mathrm{~g}} \\
\mathrm{KE}_{\mathrm{I}} & =\begin{array}{l}
\text { Kinetic energy of linear } \\
\\
\\
\text { moving load, } \mathrm{lb}-\mathrm{ft}
\end{array} \\
\mathrm{~W} & =\text { Weight of load, lb } \\
\mathrm{v} & =\text { Linear velocity of load, ft/sec } \\
\mathrm{g} & =\begin{array}{l}
\text { Gravitational acceleration } \\
\text { constant, } 32.2 \mathrm{ft} / \mathrm{sec}^{2}
\end{array}
\end{aligned}
$$

In the case of rotational loads, the energy that the brake must absorb is also kinetic energy. It is determined by the formula:

$$
\begin{aligned}
& \mathrm{KE}_{\mathrm{r}}=\frac{W \mathrm{~W}_{\mathrm{r}}^{2} \times \mathrm{N}_{\mathrm{B}}^{2}}{5875} \\
& \text { Where, } \mathrm{KE}_{\mathrm{r}}= \\
& \text { Kinetic energy of linear } \\
& \text { load, } \mathrm{lb}-\mathrm{ft} \\
& \mathrm{~W} \mathrm{~K}_{\mathrm{T}}^{2}= \\
& \text { Inertia of the rotating load } \\
& \text { reflected to brake shaft, } \mathrm{lb}-\mathrm{tt}^{2} \\
& \mathrm{~N}_{\mathrm{B}}= \\
& \text { Shaft speed at brake, } \mathrm{rpm} \\
& 5875= \text { Constant }
\end{aligned}
$$

In the case of overhauling loads, both the kinetic energy of the linear and rotating loads and the potential energy transformed into kinetic energy by the change in height or position must be considered when determining the total energy that the brake must absorb. The potential energy transformed to kinetic energy is determined by the formula:

Thus, the total energy to be absorbed by a brake stoping an overhauling load is:

$$
E_{T}=K E_{I}+K E_{r}+P E
$$

Example 10 illustrates how energy absorption for Example 8 would be determined for one stop.

Example 10: Determine the total energy absorbed by a brake in one stop.

In Example 8, the calculation for total energy to be absorbed would be as follows.
First, calculate the kinetic energy of the linear load. The load weight was $4,940 \mathrm{lb}$ and the velocity is $19 \mathrm{ft} / \mathrm{min}$ or 0.317
$\mathrm{ft} / \mathrm{sec}$. The kinetic energy is:

$$
\begin{aligned}
\mathrm{KE}_{\mathrm{I}} & =\frac{\mathrm{W}_{\mathrm{v}}{ }^{2}}{2 g} \\
& =\frac{4,940 \times 0.317^{2}}{2 \times 32.2} \\
\mathrm{KE}_{\mathrm{I}} & =7.71 \mathrm{ft}-\mathrm{lb}
\end{aligned}
$$

Next, calculate the kinetic energy for the rotational load. The motor inertia is 0.65 $\mathrm{lb}-\mathrm{ft}^{2}$ and the drum inertia reflected to the brake shaft speed is $0.0067 \mathrm{lb}-\mathrm{ft}^{2}$. The total rotational inertia at the brakemotor shaft is,

$$
\begin{aligned}
W k_{\mathrm{f}}^{2} & =W k_{\mathrm{M}}^{2}+W k_{\mathrm{f}}^{2} \\
& =0.65+0.0067 \\
W k_{\mathrm{f}}^{2} & =0.6567 \mathrm{lb}-\mathrm{ft}^{2}
\end{aligned}
$$

And the kinetic energy of the rotating components is,

$$
\begin{aligned}
\mathrm{KE}_{\mathrm{r}} & =\frac{\mathrm{W} \mathrm{~K}_{\mathrm{I}}^{2} \times \mathrm{N}_{\mathrm{B}}}{5,875} \\
& =\frac{0.6567 \times 1,150^{2}}{5,875} \\
\mathrm{KE}_{\mathrm{I}} & =147.8 \mathrm{ft-lb}
\end{aligned}
$$

Now, calculate the potential energy converted to kinetic energy due to the change in position of the load while descending. A descending load is the most severe case since potential energy is transformed to kinetic energy that the brake must absorb. A $25 \mathrm{lb}-\mathrm{ft}$ brake was selected in Example 8. The 25 lb -ft static torque rating is converted to dymanic torque,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{t}} & =\mathrm{T}_{\mathrm{S}} \times 0.8 \\
& =25 \times 0.8 \\
\mathrm{~T}_{\mathrm{t}} & =20 \mathrm{lb} \mathrm{ft}
\end{aligned}
$$

Of this torque, $13.0 \mathrm{lb}-\mathrm{ft}$ is required to overcome the overhauling load as determined in Example 8. The dynamic torque available to decelerate the load is,

$$
\begin{aligned}
\mathrm{T}_{\mathrm{d}} & =\mathrm{T}_{\mathrm{t}}-\mathrm{T}_{\mathrm{m}} \\
& =20-13 \\
\mathrm{~T}_{\mathrm{d}} & =7 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

The stopping time resulting from this dynamic torque is,

$$
\begin{aligned}
t & =\frac{W k_{T}^{2} \times N_{M}}{308 \times T_{d}} \\
& =\frac{0.691 \times 1,150}{308 \times 7} \\
t & =0.369 \mathrm{sec}
\end{aligned}
$$

Where, $\mathrm{Wk}^{2}=0.690 \mathrm{lb-ft}^{2}$ is the total inertia the brake is to retard as determined in Example 8. With the load traveling at $19.0 \mathrm{ft} / \mathrm{min}$ or $0.317 \mathrm{ft} / \mathrm{sec}$, the distance it will travel is,

$$
\begin{aligned}
s & =1 / 2 \mathrm{vt} \\
& =1 / 2 \times 0.317 \times 0.369 \\
\mathrm{~s} & =0.059 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

Wire the brake through a dedicated relay on overhauling loads where stop time or distance is critical. The potential energy transformed to kinetic energy in this distance would be,

$$
\begin{aligned}
\mathrm{PE} & =W_{S} \\
& =4,940 \times 0.059 \\
\mathrm{PE} & =291 \mathrm{ft}-\mathrm{lb}
\end{aligned}
$$

Thus, the total energy to be absorbed by the brake would be,

$$
\begin{aligned}
\mathrm{E}_{\mathrm{T}} & =\mathrm{KE} \mathrm{I}_{\mathrm{I}}+\mathrm{KE}+\mathrm{PE} \\
& =7.71+147.8+291 \\
\mathrm{E}_{\mathrm{T}} & =447 \mathrm{lb}-\mathrm{ft}
\end{aligned}
$$

The $25 \mathrm{lb}-\mathrm{ft}$ brake selected in Example 8 should be capable of absorbing $447 \mathrm{ft}-\mathrm{lb}$ of energy. The brake's maximum kinetic energy absorption rating should exceed this value.

Motor slip and test loads (150\% of load) should be considered both in sizing and thermal calculations.
Brakes overheated in testing will require inspection before using in the standard application.

## Heat dissipation in cyclic applications

In general, a brake will repetitively stop a load at the duty cycle that a standard electric motor can repetitively start the load. A brake's thermal capacity is based upon the heat it can absorb and dissipate while cycling. The thermal capacity ratings for brakes are listed in the specification tables for specific brake models.

The energy that a brake is required to absorb and dissipate by a given power transmission system is determined from the total inertia of the load and system, the rotating or linear speed of the load, and the number of times the load is to be stopped in a given time period. The rate of energy dissipation is expressed in horsepower seconds per minute (hp$\mathrm{sec} / \mathrm{min}$ ). Other common units for energy rates, such as foot pounds per second (ft$\mathrm{lb} / \mathrm{sec}$ ), can be converted to $\mathrm{hp}-\mathrm{sec} / \mathrm{min}$ using the conversion factors given in the Technical Data section.
Refer to the Thermal Capacity Chart for use above $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$ ambient temperature.
For applications demanding optimum brake performance, such as high inertial loads and frequent stops, the rate of energy dissipation required by the system is determined using the following formulas. The calculated rate of energy dissipation should not exceed the thermal capacity of the brake. Thermal dissipation requirements exceeding the brake's rating
may result in overheating of the brake to a point where torque falls appreciably. The friction material of the brake could glaze, carbonize or fail.
For rotating or linear loads, the rate at which a brake is required to absorb and dissipate heat when frequently cycled is determined by the relationship:

$$
\begin{aligned}
T C= & \frac{W \mathrm{~K}_{\mathrm{T}} \times \mathrm{N}_{\mathrm{B}}^{2} \times \mathrm{n}}{3.2 \times 10^{6}} \\
\text { Where, } \mathrm{TC}= & \text { Thermal capacity required } \\
& \text { for rotating or linear loads } \\
& \text { hp-sec/min } \\
\mathrm{W} \mathrm{~K}_{\mathrm{T}}^{2}= & \text { Total system inertia reflected } \\
& \text { to brake, lb- } \mathrm{ft}^{2} \\
\mathrm{~N}_{\mathrm{B}}= & \text { Shaft speed at brake, rpm } \\
\mathrm{n}= & \text { Number of stops per } \\
& \text { minute, not less than } 1 \\
3.2 \times 10^{6}= & \text { Constant }
\end{aligned}
$$

The rotating speed enters the formula as a squared function. Therefore, thermal requirements are of particular significance in systems where the brake will be operated at high speeds.

$$
\begin{aligned}
\text { TC }= & \frac{\mathrm{E}_{\mathrm{T}} \times \mathrm{n}}{550} \\
\text { Where, } \mathrm{TC}= & \text { Thermal capacity required } \\
& \text { for overhauling loads } \\
& \text { hp-sec/min } \\
\mathrm{E}_{\mathrm{T}}= & \text { Total energy brake } \\
& \text { absorbs, tt-lb } \\
n= & \text { Number of stops per } \\
& \text { minute, not less than } 1 \\
550= & \text { Constant }
\end{aligned}
$$

For overhauling loads, the rate at which a brake is required to absorb and dissipate heat when frequently cycled is determined by the relationship:
Example 11 illustrates how the required thermal capacity would be determined for Example 4.
Example 11: Determine the thermal capacity required to stop a rotating load frequently.

Referring back to Example 4, the flywheel will be stopped 20 times per minute. The required thermal capacity of the $6 \mathrm{lb}-\mathrm{ft}$ brake selected in this example is determined as follows.
The total inertial load the brake is to retard is $0.15 \mathrm{lb}-\mathrm{ft}^{2}$. The shaft speed of the brake motor is $1,800 \mathrm{rpm}$. Therefore, the required thermal capacity is,

$$
\begin{aligned}
T C & =\frac{W K_{T}^{2} \times N_{M}^{2} \times n}{3.2 \times 10^{6}} \\
& =\frac{0.15 \times 1,800^{2} \times 20}{3.2 \times 10^{6}} \\
T C & =3.0 \mathrm{hp}-\mathrm{sec} / \mathrm{min}
\end{aligned}
$$

The $6 \mathrm{lb}-\mathrm{ft}$ brake selected in Example 4 should have a thermal capacity rating equal to or greater than $3.0 \mathrm{hp}-\mathrm{sec} / \mathrm{min}$.

A brake with greater thermal capacity will result in greater wear life.
If productivity is to be improved in Example 4 by increasing the cycle rate, the maximum number of stops per minute is determined by the rated thermal capacity of the brake. If the $6 \mathrm{lb}-\mathrm{ft}$ brake selected in Example 4 has rated thermal capacity of $9 \mathrm{hp}-\mathrm{sec} / \mathrm{min}$, the maximum permissible stops per minute would be determined by transposing the above formula to,

$$
\begin{aligned}
\mathrm{n}_{\text {max }} & =\frac{T C_{\text {raled }} \times\left(3.2 \times 10^{6}\right)}{W k_{T}^{2} \times N_{N}^{2}} \\
& =\frac{9 \times\left(3.2 \times 10^{5}\right)}{0.15 \times 1,800^{2}} \\
\mathrm{n}_{\text {max }} & =59 \text { stops } / \mathrm{min}
\end{aligned}
$$

So, the brake could be operated up to 36 times per minute without exceeding its ability to absorb and dissipate the heat generated by the frequent stops and meet the maximum solenoid cycle rating. Cycle rate cannot exceed the solenoid cycle rate appearing in the catalog.

## Electrical Considerations

Please see page 118.

## Environmental Considerations

Brakes with standard open enclosures when mounted on NEMA C-face motors are drip-proof, except where a manual release lever has a clearance opening in the housing. The standard enclosure is commonly used on open, drip-proof and enclosed motors operating indoors or in protected outdoor environments.
NEMA 4, IP 54 enclosures are available on most brake models and are commonly used for outdoor installations, or where there are moist, abrasive or dusty environments. Standard and severe duty NEMA 4 enclosures are available in some brake series.
Brakes of various styles and materials for above or below deck on ships and dockside installation are available. The materials are usually specified by the ship designers or Navy specification MIL-B-16392C. Brakes are also available to meet MIL-E-17807B for shipboard weapon and cargo elevators. Refer to Marine, Maritime and Navy Catalog pages.

Brakes Listed by Underwriters Laboratories, Inc. and certified by Canadian Standards Association are available for use in hazardous locations, including Class I, Groups C and D; and Class II, Groups E, F and G. Motormounted, hazardous-location electric disc brakes are listed only when mounted to a Listed hazardous-location motor of the same Class and Group at the motor manufacturer's facility, and where the combination has been accepted by UL or CSA. This procedure completes the hazardous duty assembly of the brake. However, foot-mounted hazardous-location disc brakes that are Listed are also available for coupling to a motor, and may be installed by anyone.
Hazardous-location brakes are not gasketed unless indicated in the brake description. The enclosure prevents
flame propagation to the outside atmosphere through controlled clearances. Protection from weather and washdowns must be provided. If the brake is used in a high humidity or low temperature environment, internal electric heaters should be used.
Standard ambient temperature range for brake operation is from $20^{\circ} \mathrm{F}\left(-7^{\circ} \mathrm{C}\right)$ to $104^{\circ} \mathrm{F}\left(40^{\circ} \mathrm{C}\right)$. Refer to Thermal Ratings section for brake operation at higher ambient temperatures. Heaters may be available for brake operation at low ambient temperatures and high humidity environments. Ductile iron construction and heaters are recommended for prolonged cold climate use.

## Conclusion

The spring-set, electrically released disc brake is an important accessory to electric motors used in cycling and holding operations. It is available in a wide variety of enclosures. In most applications, a brake requires no additional wiring, controls or auxiliary electrical equipment. It is simple to maintain since the replaceable items, the friction discs, can be easily changed.
Many spring-set motor brakes are equipped with features such as simple wear adjustment to provide optimum friction disc life, visual wear indicator, torque adjustment and manual release. Featured on some types of brakes is automatic adjustment to compensate for friction disc wear. This feature eliminates the need for periodic adjustment and is advantageous in remote or inaccessible locations. Not all of the brakes on the market provide all of these features, but there are many Stearns motor brakes offering these features.
Care should be exercised in properly selecting a brake giving due consideration to torque as well as environment and thermal requirements.

On applications where all the pertinent information is not available, selection must be based on previous experience of the designer and user, as well as the brake manufacturer, and should be confirmed by tests under actual operating conditions. If the brake is selected with reasonable allowances made for extremes in operating conditions, it will perform its task with little attention or maintenance.

The following formulas cover the basic calculations used in brake application engineering.

| Required | Given | Formula |
| :---: | :---: | :---: |
| Full load motor torque ( $\mathrm{T}_{\text {flmt }}$ ), lb-ft | Horsepower (P), hp Shaft speed (N), rpm 5252 = Constant | $\mathrm{T}_{\mathrm{fn} \mathrm{t}}=\frac{5252 \times \mathrm{P}}{\mathrm{~N}}$ |

## Stearns Brand -

## Time Tested and Trusted for Over 90 Years

Since 1916, Stearns has been totally focused on the needs of our customers, setting the standard for brake and clutch quality, on-time delivery performance and a commitment to innovative service.

1916 Founded by R. H. Stearns
1928 Invented the DC Clutch and Brake
1935 Originated the AC Motor Brake
1953 Introduced the first UL approved Brake for Hazardous Locations
1973 Introduced the first effective self-adjust mechanism for industrial spring-set brakes
1986 Introduced SINPAC Centrifugal Switches
1995 Introduced Stearns Patented Splined Hub for longer friction disc life \& maximum heat dissipation
2007 Introduced MSHA approved brake for the mining industry
R. H. Stearns - Founder

As the largest supplier of spring-set, electrically released brakes in North America, Stearns $\boxed{\square}$ erisys Registrars commitment to quality, service, innovation and reliability continue to be the driving force behind our business.

As an ISO 9001-2000 Certified company, internal Six Sigma, Lean Manufacturing and Demand Flow programs continue to support our goal of quality products.

To assure consistant quality and reliability we have incorporated a fully integrated operation within our 100,000 square foot facility, including:
~ Research \& Development Lab
~ CNC / DNC Machine Shop
~ Complete Assembly Capability
~ Specialty Mechanical Manufacturing
~ Electronics Manufacturing

## Committed to 100\% RoHS Compliance

We are committed to providing environmentally responsible products. Specifically, we have a program in place to eliminate banned materials covered in the RoHS Directive for all our products.

To date, our fully compliant product lines include:
~ All AAB Series Products
~ All SAB Series Products
~ All SINPAC Solid-State Switches
~ All Super-Mod Electrically Applied Clutch/Brake Modules

Numerous other products can be supplied RoHS compliant upon specific
 request.

Stearns has earned the reputation as the industry's leader in delivery, quality and customer service by working directly with our customers.

With a factory trained sales force, knowledgeable customer service, world-wide distribution and complete EDI capabilities, Stearns can respond to your needs.

Stearns commitment to total customer service reaches out to your facility as well. Our field service technicians will work with your maintenance staff and plant engineers.

Stearns is fully insured and our Field Service support capabilities include:
~ Application Assistance
~ Application Engineering Support
~ Upgrade Reconfigurations
~ Troubleshooting
~ Travel for on-site technical services
~ Field training programs for your maintenance staff and sales force, on all of Stearns products.

## Notes:

[^0]:    * 56,000-80 Series includes a

    C-face gasket only, no hub seal.
    ** Subtract $\$ 30.00$ for brake
    ordered less hub.

[^1]:    * Subtract $\$ 30.00$ for brake ordered less hub.

[^2]:    * Subtract $\$ 30.00$ for brake ordered less hub.

[^3]:    * Subtract $\$ 45.00$ for brake ordered less hub.
    ** Foot mounting adds $7 \mathrm{lbs} .(3.2 \mathrm{~kg})$ to weight.
    ${ }^{1}$ These model numbers and list prices include non-standard friction discs. For high inertia or overhauling loads, it is recommended that 81,000 or 82,000 series brakes be used, as these brakes have substantially higher thermal capacities ( $50 \%$ higher for 81,000 series and $150 \%$ higher for 82,000 series).

[^4]:    (1) New! 9th digit indicates aluminum or cast iron housing 2 = Cast Iron
    3 = Aluminum: Add .38 " to " A " dimension
    (2) Subtract $\$ 230.00$ for brake ordered less hub.
    (3) Subtract 21 lbs . for aluminum housing. Foot mounting adds $40 \mathrm{lbs}(18.2 \mathrm{~kg})$ to weight.

[^5]:    (1) $\mathrm{X}=0$ or 1.0 designates a 16 in. "AK", 14 in "AJ". 1 designates 16.5 in. "AK", 14.5 in. "AJ".
    (2) Subtract $\$ 530.00$ for brake ordered less hub.
    (3) Foot mounting adds 75 lbs . $(34 \mathrm{~kg})$ to weight

[^6]:    For adapter dimensions, see Technical Data.

[^7]:    * X in 9th digit designates hub bore and shaft size.

[^8]:    * X in 9 th digit designates hub bore and shaft size.

[^9]:    *See "Ordering Information", previous page.

[^10]:    * Exceeds maximum speed rating.

[^11]:    NOTE: Non-standard bore sizes available, contact factory. Add $\$ 60.00$ for non-standard bore size.

[^12]:    *Size 2.8 can be pressure plate mounted using the long hub. The F` dimension shown for size 2.8 is for pressure plate mount using the long hub.

[^13]:    *Also the location for the external lead (on the backside of magnet body) for Series 322 only.

[^14]:    ${ }^{*}$ Kebco is a Registered Trademark of Kebco, Inc. or its affiliates. Lenze is a Registered Trademark of Lenze Power Transmission or its affiliates. Binder is a Registered Trademark of Kendrion or its affiliates.

[^15]:    *For NEMA 48C and 56C mounting, see pages 77-78, Series 321/322 NEMA C.

[^16]:    *Key to DIN 6885/3p9-Standard Metric Keyway DIN 6885/1p9
    $D 1^{* *} \& A^{* *}$ for Aluminum Cover
    D1*** \& A** for Ductile Iron Cover

[^17]:    *Standard U.S. keyseats made to ANSI B17.1 standard.

[^18]:    $\mathbf{C}_{\mathbf{S}}$ - Start capacitor, $\mathbf{M}$ - Motor main winding, $\mathbf{C}_{\mathbf{R}}$ - Run capacitor, $\mathbf{S T}$ - Motor start winding

[^19]:    $\mathbf{C}$ s- Start capacitor, $\mathbf{M}$ - Motor main winding, ST - Motor start winding, F - Forward, R - Reverse
